British Columbia Population Projections

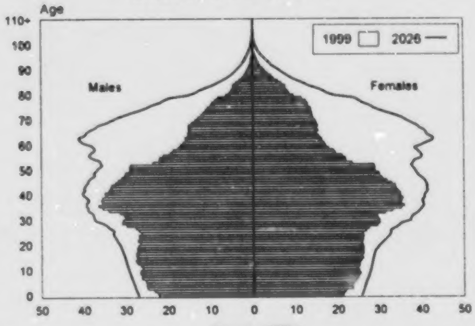
The demands for public services, such as schools, hospitals and roads, are closely related to population size and characteristics. In addition, marketing strategies of businesses are greatly influenced by the size and structure of the population. As a result, reliable population projections are an essential tool for planners in both the private and public sectors.

As we head toward the next century, British Columbia faces unique challenges within Canada. Some of the major issues emerging in our province include how to deal with strong population growth that will put even greater pressure on our urban communities, our environment and government resources; a changing ethnic make-up of the population requiring a greater understanding of the values of cultural diversity; a health care system that must meet the needs of a growing and aging population; and growing economic and income disparities between our province's regions and people.

The following are some demographic highlights from PEOPLE Projection 25:

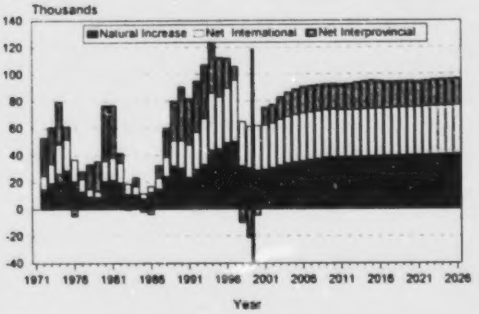
The British Columbia population is getting larger and aging. Between 1999 and 2026, the population will have increased by almost 43%. The median age of the population will have increased from 37.0 to 43.8 years.

Figure 1
British Columbia Population



BC STATS

Figure 2
Components of B.C. Population Change



BC STATS

The major factor driving population growth will be migration to British Columbia. International migration will account for 59% of the population gain, followed by interprovincial migration at 28%, and natural increase (births minus deaths) at 13%.

Even though the number of births in British Columbia will continue to rise, the contribution of natural increase to the overall population growth will decrease. Near the end of the forecast the number of deaths will exceed the number of births.

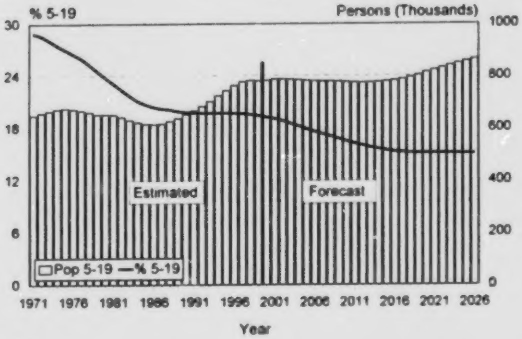
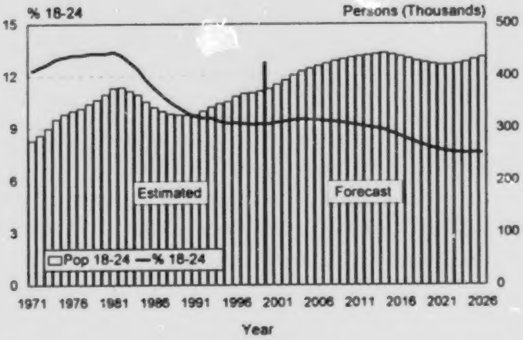
Figure 4
B.C. Population 5-19



BC STATS

Figure 5
B.C. Population 18-24

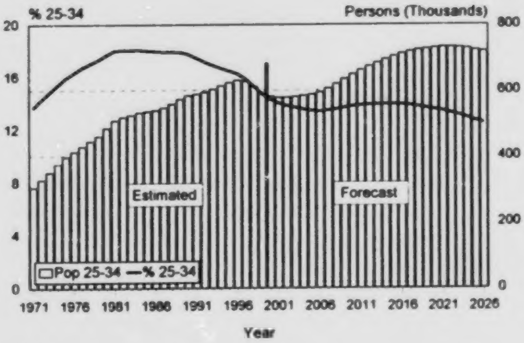


BC STATS

The population of school age (5-19 years) will remain relatively constant over the next 15 years, although its share of total provincial population will decline. However, the population of post-secondary school age (18-24 years) will continue to increase over the next decade.

The population aged 25-34, which is generally associated with first time household formation, is expected to dip due to net out-migration in the short-term, but will rise once again as migrants return to the province.

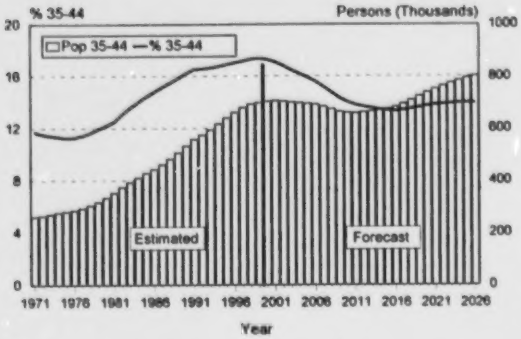
Figure 6
B.C. Population 25-34



BC STATS

Figure 7

B.C. Population 35-44



BC STATS

The population of mature labour force age (45-54 years) went through a period of slow growth for a couple of decades, but in the last ten years this trend has changed. Baby-boomers are beginning to enter this age group, and as a result, the population is increasing significantly. This will have repercussions on the labour force, especially in terms of career goals and whether or not they can be met with so many people competing for a limited number of higher level jobs.

Both the share and overall population of retirement age (65+) will continue to increase significantly from 12.9 per cent in 1999 to 21.3 per cent in 2026. The same will be true for the very senior population (80+), which will grow from 3.1 per cent of the population to 4.8 per cent. This increase will have a serious effect on health care expenditures given the high per capita health costs associated with seniors.

The population currently aged 35-44 represents the bulk of the baby-boom cohort. The population in this age group is expected to fall slightly over the next ten years, then return to strong growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 0: BRITISH COLUMBIA

GENERAL ECONOMY

Although the services sector is the largest component of British Columbia's Gross Domestic Product, the Province is still heavily dependent on natural resource industries. When inter-industry linkages are taken into account, the resource sector is still responsible for at least one quarter of the jobs in British Columbia. Forest-based industries form the most important segment of the Provincial economy. Virtually every community in the province relies to some degree on the industry. Of all manufacturing industries in B.C., wood industries rank first, followed closely by the paper and allied industries. These two industries combined account for almost one half of all manufacturing in British Columbia. Mining is another important resource industry for British Columbia. Coal mining is the most significant activity in the East Kootenay Region, and oil and gas exploration is the major economic driver of the Peace River and Northern Rockies Regions. In addition, there are a significant number of metal mines in the Province. Copper is by far the most important metal mined in British Columbia. Metal manufacturing is a significant activity for some communities, particularly Trail and Kitimat where there are large lead-zinc and aluminum smelters respectively. Other significant resource industries are agriculture and fishing. Agriculture in B.C. is very diverse, ranging from cattle ranching, to poultry farming, to fruit orchards. Most of the agricultural activity is located in the southern regions of the Province, primarily around the Okanagan and the Kootenays. Fishing is more predominant in Northern B.C., around Prince Rupert, and the north of Vancouver Island. The fish canning industry is concentrated mainly in Vancouver, Richmond and Prince Rupert. Tourism is also an important economic driver for B.C. It accounts for about 4.4 per cent of the Provincial Gross Domestic Product, which is slightly more than the direct contribution of the mining industry. The Lower Mainland and Vancouver Island-Coast Regions account for more than half of travel expenditures, and Vancouver and Victoria are among the top 20 travel destinations in the world. The high-technology sector is gaining importance and has become one of the province's leading employers.

DEMOGRAPHICS

The British Columbia population is getting larger and older. The major factor driving population growth is migration to British Columbia. The ageing of the population is caused by a long-term historical decline in fertility rates. The baby boom that occurred between the end of World War II and the mid-sixties helped delay the onset of the full effect of this ageing. As these "boomers" reach retirement age, the ageing of the population will accelerate. As the population ages, the rate of natural increase will fall, which means that migration will become an even greater part of population growth in the future.

PROJECTIONS

Interprovincial migration levels have fallen substantially after several years of extremely large inflows. The provincial share of international migration has increased over the last few years and the higher levels are expected to be maintained for at least the short-term. As a result, population growth should persist, despite the drop in interprovincial migration.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 1: FERNIE

Municipalities in Local Health Area:
Fernie, Elkford, Sparwood

GENERAL ECONOMY

The Fernie area is one of the main centres of British Columbia's coal industry. The economy of the area is driven by the coal industry with five major coal mines located there. As a result, the region is vulnerable to fluctuations in price and demand in the coal market, which are largely determined internationally.

Restructuring of some of the coal mines as they begin to face depletion of reserves could have a negative effect on the region, although the area has good potential for new discoveries. There have been a few extensions to existing mines that have either already been completed or have been certified through the Environmental Assessment Process that should add to the employment in the coal mining sector.

DEMOGRAPHICS

This region experienced strong growth through the 1970s, but depressed coal markets in the 1980s led to cutbacks in the mining sector and net migration outflows over that period. These outflows continued throughout much of the 1990s, but the area has experienced some net in-migration more recently. The gender ratio for this region is heavily weighted in favour of males, likely due to the nature of the economic activity in the area.

The age structure of this area differs significantly from that of British Columbia as a whole. Although the median age of the area's population is only slightly lower than the median age for the province as a whole, the proportion of children in the population is higher and the proportion of elderly is much lower. This is likely the result of the cutbacks in the mining sector, which resulted in the out-migration of young people to find jobs elsewhere, leaving behind the older workers with seniority, who are more likely to have families.

PROJECTIONS

Depletion of coal reserves could cause the shutdown of several of the coal mines in the region over the long-term. If world markets for coal are not sufficient to warrant construction costs associated with new mines, the diminishing employment base could result in out-migration from the area.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

Population Extrapolation for Organizational Planning with Less Error

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 2: CRANBROOK

Municipalities in Local Health Area:
Cranbrook

GENERAL ECONOMY

Cranbrook is the service centre for the East Kootenay region. As a result, its economy is tied to other areas in the region, particularly the Fernie area. Although the service sector is an important part of the economy, the forest sector is the main economic driver for the Cranbrook area.

A development that is certain to impact on this area is the impending closure of the Sullivan Mine in Kimberley by 2001. Although the mine is located outside the Cranbrook Local Health Area, the mine closure will likely have a significant impact on the service sector in Cranbrook.

DEMOGRAPHICS

Like the Fernie area, Cranbrook experienced strong growth through the 1970s, but depressed coal markets in the 1980s led to cutbacks in the mining sector in Fernie, which affected the service sector in Cranbrook, and resulted in net migration outflows over that period. In the 1990s, the region has returned to strong, positive in-migration.

The ratio of children (0 to 17) over working age population (18 to 64) is significantly higher for this area compared to the provincial average, while the ratio of elderly (65 and over) to working age population is somewhat lower relative to the province as a whole. As a result of the different age structure, the median age of the area's population is lower than the median for British Columbia as a whole.

PROJECTIONS

The shutdown of the Sullivan Mine by 2001 and the possible depletion of some of the coal mines in the Fernie area later in the projection period will likely hurt the service sector in Cranbrook. As a result, net migration to this area could be negatively affected.

Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 3: KIMBERLEY

Municipalities in Local Health Area:
Kimberley

GENERAL ECONOMY

Kimberley was built around the mining industry and to this day mining remains the leading segment in the area's economy. The Sullivan lead-zinc mine at Kimberley is the main employer in the area. Forestry is the next most significant economic activity and tourism is becoming an important economic driver for this area as well. The alpine setting of the region makes it a popular year round tourist destination.

A major development that will impact on this region is the impending shutdown of the Sullivan Mine. It is estimated that ore reserves are sufficient to keep the mine in operation only until 2001. Once the mine shuts down, a major source of employment will be lost.

DEMOGRAPHICS

The median age of the population in this area is significantly higher than the provincial median. This is likely due to the lack of employment opportunities for younger people, due to cutbacks in the mining sector in anticipation of the depletion of the ore reserves at the Sullivan Mine and its eventual shutdown. Job layoffs have left the mine with a base of older employees with seniority, and younger people have moved out of the area to find jobs elsewhere.

The ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is also significantly higher than the provincial ratio. These discrepancies may continue to widen as the Kimberley area attempts to attract more retirees in order to diversify the economy and partially compensate for the loss of the Sullivan Mine.

PROJECTIONS

The shutdown of the Sullivan Mine by 2001 will have a major impact on the population base of this area. Although there are plans to further develop the tourist industry and to attract more retirees to the region, the number of jobs in the service sector supported by these activities is significantly less than those supported by the mining sector. This means that it will take more than one tourism job to achieve the same spin-off benefits of one mining job. As a result, it is likely that this area will see some population decline for several years following the mine closure.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 4: WINDERMERE

Municipalities in Local Health Area:
Invermere, Radium Hot Springs

GENERAL ECONOMY

Forestry and tourism industries dominate the economy of this area. The tourism industry has grown rapidly with attractions such as hot springs, ski resorts and golf courses. While tourism is particularly important for some communities, some of the small communities in the area are far more dependent on the forest sector.

Recent reductions to the Allowable Annual Cut of neighbouring Timber Supply Areas could affect the timber supply of mills in the area. Some of the smaller mills could be in danger of shutting down if they cannot find sufficient fibre volumes at prices that allow them to remain competitive. This would have an impact on the employment base of the area. Expansion of tourism and retirement-related services may mitigate negative impacts in the forest sector. There are a couple of major ski resort projects either planned or under construction that could provide a significant boost to employment in the area, and consequently, to the population of the area.

DEMOGRAPHICS

This area is very sparsely populated, with a population density per square kilometre about one fifth that of the province as a whole. Growth was quite strong during the early eighties, but the area experienced population decline in the mid-eighties and early nineties. In recent years growth has been particularly robust.

The gender ratio heavily favours males in this area, in contrast to British Columbia as a whole, where there are more females than males. This is the main reason why the median age of death is significantly lower in this area (since males have a lower life expectancy than females).

PROJECTIONS

The location in the Rockies makes this area an excellent tourist location and the expansion of this sector should help sustain population growth. The ski resort projects that are planned for this area could provide a significant population burst.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 5: CRESTON

Municipalities in Local Health Area:
Creston

GENERAL ECONOMY

Forestry and agriculture are major components of this area's economy. In addition, Creston acts as the service centre for the area. There is a substantial settlement of retired people that also helps drive the service sector. The agricultural sector is comprised mainly of cattle ranching and grain and forage crops.

Developments in the forest sector could have significant effects on the Creston area. The Allowable Annual Cut of the Kootenay Lake Timber Supply Area, in which Creston is situated, was reduced in the last AAC determination; however, the previous AAC had been under-utilized so this reduction will likely have no effect in the short-term. If timber at the current AAC level can be harvested economically, there could be some additional jobs in the forest sector.

DEMOGRAPHICS

Due to its role as a retirement centre, this area has a significantly higher median age than that for British Columbia as a whole. Another consequence of a large retirement population is a significantly higher ratio of elderly (aged 65 and over) to working age population (aged 18 to 64).

There is also a higher ratio of children (aged 17 and under) to working age population. This means that there are about eight "dependants" for every ten people of working age. This is compared to the province as a whole, which has under six dependants for every ten people of working age.

PROJECTIONS

The stability of the agricultural and retirement sectors should result in stable, continuous growth for this area. The volatility of the forest sector may cause some peaks and valleys in the growth rate, but averaged over time, the population will continue to rise.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

(250) 387-0327

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 6: KOOTENAY LAKE

Municipalities in Local Health Area:
Kaslo

GENERAL ECONOMY

Forestry is an important economic activity in this area and tourism related to boat and car traffic is another significant economic activity. There are some mineral deposits in the area that could become future mines once metal prices recover from their current low levels and this could result in a significant boost to the local economy.

Developments in the forest sector could have significant effects on the Kootenay Lake area. The Allowable Annual Cut of the Kootenay Lake Timber Supply Area was reduced in the last AAC determination; however, the previous AAC had been under-utilized so this reduction will likely have no effect in the short-term. If timber at the current AAC level can be harvested economically, there could be some additional jobs in the forest sector.

DEMOGRAPHICS

This area has a substantial number of retirees, and as a result, the median age of the population is significantly higher than the provincial median. Also, the ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is higher than the British Columbia ratio.

The gender ratio is heavily weighted in favour of males, in contrast to the province as a whole, where there are more females than males, and despite the concentration of retirees (since women tend to live longer than men). Overall, the demographic structure of this area is quite a bit different from the collective make-up of the province.

PROJECTIONS

The stability of the agricultural and retirement sectors should result in stable, continuous growth for this area. The volatility of the forest sector may cause some peaks and valleys in the growth rate, but averaged over time, the population will continue to rise. If any of the mineral deposits in the area turn out to be viable, there could be a significant increase in the employment base of the area, and subsequently, in population.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 7: NELSON

Municipalities in Local Health Area:
Nelson, Salmo, Slocan

GENERAL ECONOMY

The Nelson area has a fairly well-diversified economy. The City of Nelson acts as the service centre for the region, which makes the service sector one of the main economic drivers. Forestry is another major economic driver for the area.

Major developments that could affect this area include the upgrading and expansion of the Waneta dam close to Trail, and the Keenleyside and Brilliant dams close to Castlegar. Construction activity should boost the population of those areas for the duration of the work on the dams, which will help boost the service sector in the nearby Nelson area, and may also provide construction work for people living in the Nelson area. A ferry for Kootenay Lake is being built in this area, which should provide more reliability for commercial traffic in the area, as well as some employment during the construction phase.

DEMOGRAPHICS

Unlike the other areas in this region, the gender ratio is not heavily weighted in favour of males, but rather is slightly weighted in favour of females. This is likely because the area has a large service sector and is not as dependent on the resource sectors, which are usually male-dominated professions, as are surrounding areas. The median age of the population is higher than the median age of the population for the province as a whole.

PROJECTIONS

The construction activity on the nearby dams will likely boost the growth rate for this area during the period of construction as the service sector in Nelson will benefit from the population growth in the surrounding areas. In its role as service centre for the region, the Nelson area will continue to capture the bulk of the region's growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 9: CASTLEGAR

Municipalities in Local Health Area:
Castlegar

GENERAL ECONOMY

The Castlegar area has a fairly broad economic base, drawing from forestry, mineral processing, hydro-electric generation, and services. However, forestry is the dominating industry. The Cominco lead-zinc smelter at Trail is also a significant source of employment for people living in the Castlegar area.

Major developments that could affect this area include the upgrading and expansion of the Waneta dam close to Trail, and the Keenleyside and Brilliant dams close to Castlegar. Construction activity should boost the population of both these areas for the duration of the work on the dams.

DEMOGRAPHICS

The gender ratio for this area is weighted slightly in favour of males, in contrast to the province as a whole, where there are more females than males. The dominance of the resource sectors in the economy is likely the reason for the gender imbalance, since most resource sector jobs are male-dominated. The median age of the population is somewhat higher than the corresponding figure for the province as a whole.

PROJECTIONS

Construction activity on nearby dams should provide a population boost for this area, although once construction is completed there could be some migration outflows as some of the construction force leaves the area. The outlook is for small, positive growth over most of the projection period. Near the end of the projection the excess of deaths over births is projected to be larger than the growth due to in-migration, and this will result in slight declines to the population.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 10: ARROW LAKES

Municipalities in Local Health Area:
Silverton, New Denver, Nakusp

GENERAL ECONOMY

Historically, this area was built on mining during the 1860s' Gold Rush, but ore depletion has forced the shutdown of most mines, leaving only small mines with little ore. Forestry is now by far the most significant economic activity in this area, replacing the mining industry.

There are still a number of ore deposits in the area that could be exploited. If metal prices increase enough, it may become economical to open new mines. New mineral activity could create significant employment opportunities in this area. The Silvana mine, in particular, is one that could be re-activated sometime soon.

DEMOGRAPHICS

The gender ratio in this area is weighted heavily in favour of males, in contrast to the province as a whole, where there are more females than males. This is probably due to the abundance of male-dominated jobs in the resource sectors, which are the core of the area's economy.

The median age of the population in this area is substantially higher than the provincial median, and there is a higher proportion of elderly in the population compared to the province as a whole.

PROJECTIONS

This area has experienced large swings in migration coinciding with the economic cycle in the resource sectors, and will likely continue to do so. However, when averaged over time, population growth in this area should be positive.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 11: TRAIL

Municipalities in Local Health Area:
Trail, Rossland, Fruitvale, Warfield, Montrose

GENERAL ECONOMY

The Cominco lead-zinc smelter at Trail is the primary economic activity in this area. Most of the working people in the area are either directly employed by Cominco, or work in a job providing goods and services that is directly or indirectly dependent on Cominco. Other significant sectors include forestry and construction activity associated with nearby dams.

Major developments that could affect this area include the upgrading and expansion of the Waneta dam close to Trail, and the Keenleyside and Brilliant dams close to Castlegar. Construction activity should boost the population of both these areas for the duration of the work on the dams.

DEMOGRAPHICS

This area experienced population outflows throughout most of the eighties, due in part to the downturn in the resource sectors and because of down-sizing of the Cominco smelter. There has been little growth since then, and more recently more population declines have occurred. The smelter has continued to down-size through attrition, leaving fewer employment opportunities. As a result, many young people have moved on to find employment elsewhere.

With young people moving away, those that are left are more likely to be workers with seniority who are more likely to own homes in the area and to have families. Correspondingly, the median age of this area's population is higher than the provincial median, yet the proportion of children is also higher.

PROJECTIONS

Developments at the Cominco smelter will continue to influence the population growth in this area. The hydro-electric projects should provide an employment boost for the period of construction, which may keep more younger people in the area. It is likely that the worst of the job loss has passed and this area will begin to see some population inflows in the future.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 12: GRAND FORKS

Municipalities in Local Health Area:
Grand Forks

GENERAL ECONOMY

This area is highly dependent on forestry. Historically, mining was the activity on which most of the communities in the area were built, but ore depletion has closed most of the mines and reduced the significance of mining. Tourism has become another important economic activity in the area.

There are still significant mineral deposits in the area, and if copper prices warrant, renewed mineral activity may occur. However, at current prices it is unlikely that any mining will proceed.

DEMOGRAPHICS

The median age of the population in this area is significantly higher than the provincial median. As a result, the ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is substantially higher than that of the province as a whole.

The dependence on the resource sector is probably the reason for a male bias in the gender ratio. This is in contrast to the province as a whole, where there are more females than males.

PROJECTIONS

Due to the older population, the natural increase, or excess of births over deaths, has become negative in recent years for this area (i.e., the number of deaths is greater than that of births), and is expected to remain negative throughout the projection period. Migration, on the other hand, should be positive, offsetting any losses from the negative natural increase. Population growth in this area is likely to be slow, but positive, throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

P. E. O. P. L. E.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 13: KETTLE VALLEY

Municipalities in Local Health Area:
Greenwood, Midway

GENERAL ECONOMY

This area is highly dependent on forestry. Historically, mining was the activity on which most of the communities in the area were built, but ore depletion has closed most of the mines and reduced the significance of mining. Tourism has become another important economic activity in the area.

There are still significant mineral deposits in the area, and if copper prices warrant, renewed mineral activity may occur. However, at current prices it is unlikely that any mining will proceed.

DEMOGRAPHICS

Migration to this area has been fairly erratic in the past, with inflows one year followed by outflows the next. Inflows were particularly high in the last half of the 1990s, possibly due to increased activity in the forest sector from a temporary uplift in the allowable cut due to beetle-damaged timber.

The gender ratio in this area is substantially biased in favour of males, in contrast to the province as a whole, where there are more females than males. The dependence on the resource sectors, where most jobs are male-dominated, is probably the explanation for this gender imbalance. The total fertility rate in this area is also substantially higher than the provincial average.

PROJECTIONS

With the removal of the temporary license to harvest beetle-damaged timber, the unusually high inflows to this region have ceased. It is likely that migration to this area will revert to a more historical pattern of alternating small inflows and outflows. Averaged over the projection period, these flows will likely be positive overall and this area should continue to experience small, steady growth.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop[illegible]5+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

(250) 387-0327

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Oliver, Osoyoos

GENERAL ECONOMY

Like much of the Okanagan region, this area is highly dependent on agriculture and tourism. There is also a significant base of retired people living in the area. The warm and pleasant climate helps draw tourists and retirees to the area and the service sector relating to these two groups is a significant economic driver. The climate also makes the region perfectly suited to growing tree fruits and vegetables, although cattle ranching is also an important activity in the agricultural sector.

The Coquihalla Connector reduced travel time from the coast and made the Okanagan region more accessible from the Lower Mainland. As a result, the tourist trade has been growing and is becoming a more significant element of the economy.

DEMOGRAPHICS

Other than a brief period in the mid-eighties, this area has generally experienced positive net inflows of migrants. Population growth in this area has been significantly higher than the provincial average for most of the last decade, although it slowed in the last couple of years to less than the average provincial growth.

The median age of the residents of this area is substantially higher than the provincial median age. This is due to the large base of retired people that have settled in the region. Other demographic differences that are a direct result of this abundance of retirees are a significantly higher percentage of females (since women tend to live longer than men), and a substantially higher elderly dependency ratio (i.e., the proportion of people aged 65 and over compared to the working age population of those aged 18 to 64).

PROJECTIONS

The stability of the agricultural sector and retirement-related services should ensure stable growth for this region. This area will likely continue to receive strong inflows of migrants, although as time goes on, it will lose an increasing number of people due to a negative rate of natural increase (i.e., the number of deaths will exceed the number of births); however, growth will remain positive.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 15: PENTICTON

Municipalities in Local Health Area:
Penticton

GENERAL ECONOMY

The City of Penticton is the service centre for the region, and consequently, the service sector is the most significant part of the economy of this area. The economy is fairly well diversified with tourism and forestry both contributing significantly to the economy. There is also a significant retirement community in the area, drawn by the pleasant climate.

The Coquihalla Connector reduced travel time from the coast and made the Okanagan region more accessible from the Lower Mainland. As a result, the tourist trade has been growing and is becoming a more significant element of the economy.

DEMOGRAPHICS

This area has generally experienced positive net inflows of migrants. Population growth in this area has been significantly higher than the provincial average for most of the last decade, although it slowed in the last few years to less than the average provincial growth.

The median age of the residents of this area is substantially higher than the provincial median age. This is due to the large base of retired people that have settled in the region. Other demographic differences that are a direct result of this abundance of retirees are a higher percentage of females (since women tend to live longer than men), and a substantially higher elderly dependency ratio (i.e., the proportion of people aged 65 and over compared to the working age population of those aged 18 to 64).

PROJECTIONS

The diversified economy should ensure stable growth for this area. It is projected that migration to this region will continue to be strong and will more than offset any losses due to a negative natural increase (i.e., an excess of deaths over births).

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 16: KEREMEOS

Municipalities in Local Health Area:
Keremeos

GENERAL ECONOMY

Agriculture is the main driver of the economy of this area. The only significant mine in the area, the Nickel Plate Mine at Hedley, was shut down in 1996 due to ore depletion. However, there are other mineral prospects in the area that could be developed sometime in the future.

DEMOGRAPHICS

The gender ratio for this area is significantly biased toward males, in contrast with the province as a whole, where there are more females than males. This is likely due to the nature of the economy in the area. Other demographic factors are also significantly different from the provincial average: the fertility rate for this area is substantially higher; the median age of the population is much higher, and as a result the ratio of elderly (those aged 65 and over) to the working aged population (those aged 18 to 64) is also much higher.

PROJECTIONS

There are prospects for renewed mining activity in this area that may provide a significant population boost, but otherwise this area should continue to experience slow, stable population growth throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 17: PRINCETON

Municipalities in Local Health Area:
Princeton

GENERAL ECONOMY

Forestry is the leading economic driver in this area, with mining also playing a significant role, although the closure of the Similco mine has reduced the employment base in that industry. Tourism is also becoming increasingly significant.

A development significantly affecting this area is the continued shutdown of the Similco Mine. The mine was closed due to poor copper prices, but could re-open if prices improve enough. It is believed to have enough reserves for a five to ten year life. If the mine does re-open, there could be some return migration to the area.

DEMOGRAPHICS

Migration to this area has been fairly volatile over the last 20 years with alternating inflows and outflows. This is probably due to the nature of the economic activity in this area and the dependence on resource sector industries.

The gender ratio for this area is heavily biased in favour of males, in contrast to the province as a whole where there are more females than males. Men tend to have a lower life expectancy than women and the higher proportion of males in the population is reflected in the median age of death, which is significantly lower than the provincial median. However, the median age of the population is significantly higher than the provincial median and this is reflected in a higher elderly dependency ratio (i.e., the ratio of those aged 65 and over to those in the working aged population of 18 to 64).

PROJECTIONS

This area could experience some return migration if the Similco Mine re-opens, otherwise the area will probably experience small net inflows or outflows throughout the projection period. Averaged over the projection period, these flows will likely be positive overall, but it is likely that the number of deaths will exceed the number of births in this area throughout the projection and this will offset any in-migration and result in a slow population decline over time.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 18: GOLDEN

Municipalities in Local Health Area:
Golden

GENERAL ECONOMY

The forest sector is by far the most significant economic driver in this area. Evans Forest Products (now owned by Louisiana-Pacific) is the main employer in the area and most of the residents of Golden are either directly or indirectly dependent on the operations of the company. Another significant employer in the area is Canadian Pacific Rail, which has a car repair shop located in Golden. Tourism is starting to become more important for this area as well. The location, surrounded by the Rocky Mountains and close to five National Parks, makes it a popular place to visit.

The forest sector in this region has been struggling over the last few years. The Evans Forest Products' mill, which was in real danger of shutting down, has managed to keep afloat, which is good news for the community, but if it ever does shut down permanently, there will likely be significant population effects for this area.

DEMOGRAPHICS

Due to the dependence on the male-dominated forest industry, the gender ratio of this area is heavily weighted in favour of males. This is in contrast to the province as a whole, which has more females than males. Since the life expectancy of males is less than females, the median age at death is significantly lower in this area compared to the British Columbia median. The median age is also significantly lower than the provincial median and this is reflected in the child and elderly dependency ratios. The child dependency ratio (the ratio of those aged 17 and under to those aged 18 to 64) is significantly higher, and the elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64) is significantly lower, than the corresponding provincial ratio.

PROJECTIONS

This area's reliance on the forest sector makes it susceptible to fluctuations within the industry. Unless there is some further diversification of the region's economy, there will likely be very little population growth.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 19: REVELSTOKE

Municipalities in Local Health Area:
Revelstoke

GENERAL ECONOMY

Forestry and tourism are the main economic drivers for this area. In addition, Canadian Pacific Rail is an important employer, and construction and maintenance related to dams in the area also provide significant employment.

This area has suffered setbacks in the forestry and mining sectors in the past few years and has experienced some net out-migration as a result. There are some promising mineral deposits that could be developed once metal prices improve that could revitalize the mining industry.

DEMOGRAPHICS

This area has had a history of back-to-back mega-projects, which have kept the population artificially high. This was particularly evident from the large net migration outflows in the eighties, when there were no new projects to keep the construction force in the area. Net inflows in the early nineties indicate that the area may have reached a more natural population level.

The gender ratio in this area is weighted in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the economic dependence on forestry and construction, which are male-dominated professions.

PROJECTIONS

This area will probably experience small net outflows of migrants over most of the projection period, but the positive natural increase (i.e., the excess of births over deaths) should offset the outflows for most of the projection period, although as the population ages, the natural increase will decline, and eventually this area could experience further population decline.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 20: SALMON ARM

Municipalities in Local Health Area:
Salmon Arm, Sicamous

GENERAL ECONOMY

The economy of this area is not as diversified as is the case with the other large centres in the Okanagan. Forestry is by far the most significant economic activity in the area. Some of the smaller centres, in particular, are highly dependent on the forest sector. Agriculture is another significant economic activity, as it is in most parts of the Okanagan, but it is not as important to the economy as is forestry.

DEMOGRAPHICS

This area has generally experienced net migration inflows, except for a period in the mid-eighties when there were outflows, probably due to the downturn in the forest sector. Inflows were particularly high in the last half of the nineties, and it appears that the area is receiving some spin-off growth from the North and Central Okanagan.

The median age of the area's population is significantly higher than the provincial median. This is due to a significant concentration of retirees, as witnessed by the significantly higher elderly dependency ratio (i.e., the ratio of those 65 and over to those 18 to 64) compared to the province as a whole.

PROJECTIONS

The location of the area just north of the North and Central Okanagan and east of the Kamloops area will ensure that it continues to experience spin-off growth. If the area is to continue to grow at the pace it has in recent years, it will likely have to diversify its economy somewhat more than it is currently. However, the projection is for strong net migration inflows to continue throughout the projection period, which translates to strong population growth for the area.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 21: ARMSTRONG-SPALLUMCHEEN

Municipalities in Local Health Area:
Armstrong, Spallumcheen

GENERAL ECONOMY

The main economic activities in this area are agriculture and forestry. The stability of the agricultural sector has helped reduce the cyclical effects of the forest sector economy and has kept the population of this area fairly stable.

DEMOGRAPHICS

Like many areas in British Columbia with an economic dependence on the forest sector, this area experienced net outflows of migrants in the mid-eighties when the forest sector was experiencing a downturn. Other than this exception, the area has generally had net inflows of migrants. The stability of the agricultural sector and the pleasant climate are contributory factors to population stability in this area.

The median age of the area's population is significantly higher than the provincial median, and the elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is also higher than the provincial ratio. However, the total fertility rate is also substantially higher than the British Columbia rate, and the child dependency ratio (i.e., the ratio of those aged 17 and under to those aged 18 to 64) is much higher than the provincial ratio. Thus, the overall dependency ratio is about eight percentage points higher than it is for British Columbia as a whole.

PROJECTIONS

As with most of the Okanagan region, this area has been experiencing strong growth in recent years due to large net inflows of migrants. This strong growth is projected to continue throughout most of the projection period.

Prepared by:
Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 22: VERNON

Municipalities in Local Health Area:
Vernon, Coldstream, Lumby

GENERAL ECONOMY

The economy of the Vernon area is well diversified. Forestry, tourism and agriculture all are important primary activities. Also, Vernon acts as a service centre for the region. The agriculture sector in this area is comprised of almost every type of farming to be found in the province, ranging from fruits and vegetables, to dairy products and livestock.

The Silver Star ski resort is planning to expand, possibly doubling in size over the next ten years. This could result in some significant in-migration to the area as there will be substantial job growth at the resort, not only in construction, but also in operations.

DEMOGRAPHICS

This area has generally had net inflows of migrants, except for a period in the mid-eighties when the downturn in the forest sector resulted in some net migration outflows. In more recent years, like most of the Okanagan region, this area has experienced large net inflows of migrants. The diversity of the economy helps make this one of the fastest growing areas in the Okanagan. The population of the area has more than doubled in the last 25 years.

The median age of the area's population is significantly older than the provincial median. The pleasant climate makes this a popular place to retire. As a result, the elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is significantly higher than the provincial ratio. The larger proportion of elderly is probably the reason why the gender ratio is weighted in favour of females, since women tend to live longer than men.

PROJECTIONS

The Okanagan region is one of the fastest growing areas in the province, and will likely continue to be for some time. The Vernon area is one of the key areas in the region and it is projected that net migration will continue to be high to this area, and as a result, population growth will remain strong.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 23: CENTRAL OKANAGAN

Municipalities in Local Health Area:
Kelowna, Peachland, Lake Country

GENERAL ECONOMY

The economy of this region is well diversified. Agriculture, forestry, and tourism all are important industries in the region. The warm climate makes this area one of the more important agricultural centres in the province and is one of the attractions for tourists. It also makes the region a popular retirement centre.

The stability of the agricultural and tourism sectors and the popularity of the region as a retirement centre should ensure continued growth for this region. The Coquihalla highway has made this area even more popular as a tourist destination, and the improved transportation links to the Lower Mainland have enhanced the Central Okanagan as a place to locate secondary industry.

DEMOGRAPHICS

High inflows of interprovincial migrants have resulted in the population of this area more than doubling in the last 25 years. This region was one of the highest growth areas in the province through the nineties.

Due to the presence of a large retirement base, the median age of the population is significantly higher than the provincial median. Since women tend to live longer than men, this also helps explain the bias towards females in the gender ratio. The ratio of females to males is significantly higher than the provincial ratio. The elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is significantly higher than the ratio for the province as a whole.

PROJECTIONS

The diversity of the economy and the pleasant climate make this area one of the more popular locations to move to in the province. This will likely continue to be the case for some time and this region can expect to continue to receive large net inflows of migrants throughout the projection period. As a result, population growth in this area will remain strong.

Prepared by
Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. LOCAL HEALTH AREA 24: KAMLOOPS

Municipalities in Local Health Area:
Kamloops, Logan Lake, Chase

GENERAL ECONOMY

Forestry and mining are the main economic drivers for this area, but overall, the economy is quite diversified. Although the Highland Valley mine at Logan Lake is the only mine currently operating in the area, there are many other potential deposits that could be exploited.

A development that will have a substantial impact on the population of this region will be the closure of the Highland Valley Mines. The magnitude of the mine will ensure that significant population impacts will occur. The mine is scheduled to close around 2008. The Afton Mine near Kamloops, which closed in 1997, is undergoing test drilling and may be re-opened if the drilling brings positive results.

DEMOGRAPHICS

Like many regions in British Columbia with a significant dependence on the forest sector, this region experienced net migration outflows through the mid-eighties. Since that time, the population has been steadily growing. The age structure of this area is fairly similar to the province as a whole, with only a slightly younger age distribution.

PROJECTIONS

The closure of the Highland Valley Mines will have a significant effect on the population of this area, reducing migration inflows to the area for several years. However, the diversity of the area's economy will ensure that the net migration will remain positive and strong. The projection is for this area to continue to experience strong population growth throughout the projection period.

Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 25: 100 MILE HOUSE

Municipalities in Local Health Area:
100 Mile House

GENERAL ECONOMY

Forestry is the main economic driver for this region, with the manufacturing industry concentrated in the forest sector in the sawmills and the oriented strandboard mill at 100 Mile House. Tourism is becoming another important economic activity in the area.

DEMOGRAPHICS

The median age of the population of this area is significantly older than the provincial median. Despite this, the child dependency ratio (the ratio of those aged 17 and under to those aged 18 to 64) is significantly higher, and the elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64), somewhat lower, than the provincial ratios.

The dependence on male-dominated resource sector industries is the reason for a gender ratio that is weighted in favour of males, in contrast to the province as a whole, where there are more females than males.

PROJECTIONS

This area has experienced fairly steady net inflows of migrants and this is expected to continue to be the case throughout the projection period. The natural increase (i.e., births minus deaths) is also expected to contribute to population growth, at least for the next 20 years, after which the number of deaths is expected to outnumber births. However, the net migration should more than offset any declines due to natural increase and the population should grow throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

Population Extrapolation for Organizational Planning with Less Error

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC Stats* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC Stats, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC Stats will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 26: NORTH THOMPSON

GENERAL ECONOMY

This area is highly dependent on the forest industry, both through harvesting and processing. Tourism and agriculture are also significant economic activities in the area, but to a much lesser extent than forestry. Agriculture is done mostly on a small scale, and tourism is not yet fully developed, although Wells Gray Provincial Park is a big draw for tourists.

DEMOGRAPHICS

Net migration to this area was negative through most of the eighties, but there were net migration inflows through most of the nineties. The gender ratio in this area is heavily biased in favour of males, in contrast to the province as a whole where there are more females than males. The reason for the gender imbalance is the dependence on the male-dominated forest sector jobs. As a result of the bias toward males, and the fact that men tend to have a lower life expectancy than females, the median age of death is significantly lower than the provincial median.

The median age of the population is also significantly lower than the provincial median and there is a higher proportion of children (aged 17 and under) to working age population (aged 18 to 64), and a lower proportion of elderly (aged 65 and over) to working age population compared with British Columbia as a whole.

PROJECTIONS

This area is sparsely populated and there are no incorporated municipalities located within North Thompson. The communities within the region are small and it is unlikely that they will suddenly begin to grow into urban centres. It is more probable that the migration pattern for this area will be one of small net inflows or outflows and that population growth in this area will be relatively flat over the projection period.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 27: CARIBOO-CHILCOTIN

Municipalities in Local Health Area:
Williams Lake

GENERAL ECONOMY

Forestry is the main economic driver for this region, but tourism, cattle ranching and mining also play significant roles in the economy. There is currently one major mine operating in the area—the Mount Polley gold/copper mine, which began operation in 1997. The Gibraltar mine near Williams Lake was closed in February 1999 due to low ore grades and low prices. In the future, the Prosperity Gold/Copper Mine has the potential to be one of the largest mines in the province once it goes ahead.

Another major development that could affect this region is the eventual cancellation of the temporary licenses for beetle-killed timber in the Williams Lake Timber Supply Area. It is estimated that the timber attributable to this temporary uplift in the Allowable Annual Cut is responsible for over 500 direct jobs and 200 indirect jobs. The uplift has been extended until around 2001, but will eventually be removed, and at that time significant employment effects will be felt in this region.

DEMOGRAPHICS

This region experienced net migration outflows through much of the eighties, probably due to the downturn in the forest sector. The temporary license for beetle-killed timber has helped boost employment in the forest sector and has attracted more people to the area in recent years. The dependence on male-dominated resource sector industries is the reason for a gender ratio that is weighted in favour of males, in contrast to the province as a whole, where there are more females than males. The median age of the population of this area is significantly younger than the provincial median. This is reflected in the child dependency ratio (the ratio of those aged 17 and under to those aged 18 to 64), which is significantly higher, and the elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64), which is significantly lower, than the corresponding provincial ratio.

PROJECTIONS

This area could experience significant growth if the new mines come on line, although there will likely be outflows due to the recent mine closure. The cancellation of the temporary licenses for beetle-killed timber, when it occurs, could result in net outflows for a few years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 28: QUESNEL

Municipalities in Local Health Area:
Quesnel, Wells

GENERAL ECONOMY

Forestry is by far the main economic activity in this area, although tourism and cattle ranching are also significant industries. There are several large processing facilities in Quesnel that provide significant employment. Historically, mining was the industry on which this area was built, but it is only a small part of the economy now. A new mine, the Quesnel River Mine, opened in 1995, but it shut down in March 1998 due to low gold prices. There are other mineral deposits that could be developed once prices improve.

DEMOGRAPHICS

This area experienced net migration outflows through most of the eighties and the early nineties, probably due in part to the downturn in the forest sector. The dependence on the forest sector is also the reason for the gender bias in favour of males, in contrast to the province as a whole, where there are more males than females.

The median age of the population of this area is significantly younger than the provincial median. This is reflected in the child and elderly dependency ratios. The child dependency ratio (the ratio of those aged 17 and under to those aged 18 to 64) is significantly higher, and the elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64) is significantly lower, than the provincial ratios.

PROJECTIONS

The projection for this area is for small net migration inflows, which means growth will be driven by the natural increase (i.e., the excess of births over deaths). Since the natural increase is expected to remain positive through most of the projection, this area should experience growth throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 29: LILLOOET

Municipalities in Local Health Area:
Lillooet

GENERAL ECONOMY

The economy of this area is largely based on the forestry industry, although tourism is also a significant economic driver. There is a proposal to develop the Melvin Creek area just south of Lillooet that could have a substantial impact on the population of this area.

Another development that could affect this area is the proposal to reactivate the Bralorne Gold Mine, which has been shut down since 1970. The mine would provide significant employment for the five years it is scheduled to operate. However, it is unlikely that this mine will proceed until the price of gold improves.

DEMOGRAPHICS

The gender ratio for this area is heavily weighted in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the dependence on the male-dominated employment of the resource sectors. Since men tend to have a lower life expectancy than women, the median age of death is significantly lower than the provincial median.

The median age of the population is much lower than the provincial median, and the ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher than the provincial ratio.

PROJECTIONS

This area should benefit from spin-offs from Whistler. Migration to the area has been erratic in the past with net inflows alternating with net outflows, but the increasing popularity of the Whistler area is likely to have a positive effect on this neighbouring area as well. The projection for this area is for small, positive migration combined with positive natural increase (i.e., the excess of births over deaths), which will combine for slow, steady growth.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

(250) 387-0327

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 30: SOUTH CARIBOO

Municipalities in Local Health Area:
Ashcroft, Cache Creek, Lytton, Clinton

GENERAL ECONOMY

The main economic drivers in this area are forestry and mining. The Blackdome Mine was re-opened in 1998, but has since shut down once again due to low gold prices. Once prices improve, the mine may again re-open. In the forest sector, the sawmill at Clinton was recently expanded, which should attract some people to the area. Other important economic activities in the area include tourism and agriculture.

DEMOGRAPHICS

This area has undergone dramatic swings in migration, with an upsurge in the early eighties followed by a long period of net outflows through the remainder of the eighties, and finally net inflows more recently. The economic dependence on the resource sectors is the reason for a gender bias in favour of males, which contrasts with the province as a whole, which has more females than males.

The median age of the population is higher than the provincial median despite the fact the ratio of children (aged 17 and under) to working age population (aged 18 to 64) is also significantly higher than the provincial ratio. The total fertility rate is also much higher than the provincial rate.

PROJECTIONS

Despite the migration swings this area has experienced, the population has remained fairly stable through the last 25 years. This is mostly due to a positive natural increase (the excess of births over deaths), which has offset any losses due to migration. As the population ages, the natural increase will decline and will eventually become negative. As a result, the population of this area will likely experience a slow decline over the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 31: MERRITT

Municipalities in Local Health Area:
Merritt

GENERAL ECONOMY

Forestry is the main economic driver for this area, although tourism, mining and agriculture are also important industries. There are three large sawmills in Merritt that provide a significant amount of employment. In the agricultural sector, cattle ranching is the main activity. The Nicola Valley is one of the best-known cattle ranching areas in the province. Tourism to this area has increased since the completion of the Coquihalla Highway and may become even more significant in the future.

A development affecting this area is the temporary uplift to the Allowable Annual Cut of the Merritt Timber Supply Area due to fire and a beetle epidemic. The extra harvest may provide more logging jobs for this area.

DEMOGRAPHICS

Migration to this area has been fairly erratic, with alternating periods of net inflows and net outflows. The economic dependence on the resource sectors is the reason for a gender bias in favour of males, which contrasts with the province as a whole, which has more females than males.

The median age of the population is lower than the provincial median and the ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher than the provincial ratio. The total fertility rate is also much higher than the provincial rate.

PROJECTIONS

It is projected that net migration to this area will be positive and the natural increase (the excess of births over deaths) will also be positive, and the combined result will be steady population growth.

Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 32: HOPE

Municipalities in Local Health Area:
Hope

GENERAL ECONOMY

Forestry drives the economy of this area, and most of the forestry-related employment is derived from harvesting. The municipality of Hope is strategically located to act as a service centre for people travelling between the Lower Mainland and the Interior, or points north. As a result of its role as a rest-stop for travellers, tourism is another important economic driver for the area.

The recent reduction of the Allowable Annual Cut for the Fraser Timber Supply Area, in which the Hope LHA is situated, could have a deleterious effect on the employment base of the area. The AAC has been reduced by 28 percent since 1995 and the reduction will likely lead to significant job loss in the harvesting sector in this area.

DEMOGRAPHICS

This area has experienced some volatility in terms of net migration, with net inflows alternating with net outflows. The largest outflows occurred in the mid-eighties and were probably related to the downturn in the forest sector.

The gender ratio of this region is weighted slightly in favour of males, as opposed to the province as a whole, where there are more women than men. This is probably due to the importance of forestry to the economy of the area, and the fact that most forestry jobs tend to be male-dominated. Historically, this bias was even greater, but as the service sector has expanded, the gender imbalance has slowly diminished. The fertility rate for this area is substantially higher than the provincial rate, which is partly the reason that there are also proportionately more children in the population.

PROJECTIONS

Timber supply reductions could result in some population impacts for this region, particularly in the short-term, but the strength of the service sector should ensure stable growth over the long-term. It is expected that migration to this area will be fairly steady throughout the projection period. There may be some year-to-year volatility, but averaged over the period, growth should be positive.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 33: CHILLIWACK

Municipalities in Local Health Area:
Chilliwack

GENERAL ECONOMY

Agriculture and forestry are the main economic activities in the Chilliwack area. The Allowable Annual Cut for the Fraser Timber Supply Area, in which the Chilliwack LHA is located, has been reduced by 28 percent since 1995 and this will likely result in significant job loss in the harvesting sector in this area. Another thing that could affect the growth patterns of this area is the recent agreement on the Livable Region Strategic Plan by the GVRD. As the GVRD begins to put the infrastructure in place to promote its Growth Concentration Area, the recent trend of growth moving out into the Valley will likely slow considerably. Growth rates experienced in the last decade will be substantially higher than those experienced in the next.

DEMOGRAPHICS

This area is considered one of the more rural areas in the Lower Mainland, yet its population density is well over 10 times that of the density of the province as a whole. The rural nature of the area is reflected in the total fertility rate, which is substantially higher than the provincial rate. The higher fertility rate is partly the reason why the ratio of children (aged 17 and under) in the population to the working age population (aged 18 to 64) is significantly higher in this area compared to British Columbia as a whole.

PROJECTIONS

This region has experienced rapid growth over the last decade. The closure of the Armed Forces Base and of Fraser Valley Foods, both major employers, slowed growth considerably, but the area should once again experience strong growth over the long-term. Despite the GVRD's plan to manage growth, which will likely slow movement to the Chilliwack area, the proximity to the GVRD and availability of land will ensure that this area will continue to grow, although at reduced rates compared to recent years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 34: ABBOTSFORD

Municipalities in Local Health Area:
City of Abbotsford

GENERAL ECONOMY

Agriculture has traditionally been the main economic driver of this area, but more recently, as transportation networks have improved, the area has become more of a residential and industrial suburb of the GVRD. With land priced lower than in the GVRD, this area has attracted industrial and warehousing operations. Agriculture remains an important activity as well.

The recent agreement by the municipalities in the Greater Vancouver Regional District (GVRD) on a Livable Region Strategic Plan will also have consequences for this region. As the GVRD begins to put the infrastructure in place to promote its Growth Concentration Area, the recent trend of growth moving out into the Valley will likely slow considerably. Growth rates experienced in the last decade will be substantially higher than those experienced in the next.

DEMOGRAPHICS

This area is considered one of the more rural areas in the Lower Mainland, yet its population density is about 65 times that of the density of the province as a whole. The rural nature of the area is reflected in the total fertility rate, which is substantially higher than the provincial rate. The higher fertility rate is partly the reason why the ratio of children (aged 17 and under) in the population to the working age population (aged 18 to 64) is significantly higher in this area compared to British Columbia as a whole.

PROJECTIONS

This region has experienced rapid growth over the last several years. The GVRD's plan to manage growth will likely slow the movement to the Valley and growth to the Abbotsford area should slow as well. The proximity to the GVRD and availability of land will ensure that this area will continue to grow, but likely at much reduced rates compared to recent years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 35: LANGLEY

Municipalities in Local Health Area:
District of Langley, City of Langley

GENERAL ECONOMY

This area acts largely as a residential and industrial suburb of Vancouver. At one time agriculture was the main economic activity in this area, and it continues to be a significant industry. In addition, the industrial base of the area has increased as more firms move away from Vancouver to take advantage of less costly land and to be closer to their customers.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. As Langley is not part of the Growth Concentration Area, it may experience less growth than it would in absence of a regional plan.

DEMOGRAPHICS

This area has more than quadrupled its population since 1971. It has experienced strong steady growth every year in the last 30 years. The median age of the population is slightly younger than the provincial median, and the ratio of children (aged 17 and under) to the working age population (aged 18 to 64) is significantly higher than the British Columbia ratio. This is likely due, at least in part, to the significantly higher fertility rate in this area compared to the province as a whole.

PROJECTIONS

The recent agreement on a Livable Region Strategic Plan for the GVRD could limit growth to this area to some extent, but the availability of land for development should ensure strong growth nonetheless. This area also has a high, positive natural increase (i.e., the excess of births over deaths), and this will also contribute to population growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 36: SURREY

Municipalities in Local Health Area:
Surrey, White Rock

GENERAL ECONOMY

The Surrey area has been one of the fastest growing regions in the province for several years. It is a major residential suburb of Vancouver, although it still retains a significant amount of agricultural land. White Rock has become somewhat of a retirement centre.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Most of the Surrey area is included in the Growth Concentration Area, which means it will continue to be one of the high growth areas in the province.

DEMOGRAPHICS

This area is one of the most populous in the province with a population density of over 1,000 people per square kilometre. In the last 25 years it has almost tripled in size. The median age of the population is younger than the provincial median, and the ratio of children (aged 17 and under) to the working age population (aged 18 to 64) is significantly higher than the British Columbia ratio. This is likely due, at least in part, to the substantially higher fertility rate in this area compared to the province as a whole.

PROJECTIONS

Since Surrey is designated as part of the Growth Concentration Area in the GVRD's Livable Region Strategic Plan, it is likely that the high levels of population growth experienced recently in this area will continue into the future.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 37: DELTA

Municipalities in Local Health Area:
Delta

GENERAL ECONOMY

The Delta area is a residential suburb of Vancouver and most of its residents work outside the area. The Agricultural Land Reserve (ALR) is a major constraint to growth in this area as it restricts the amount of land available for residential and commercial use.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Most of Delta is outside the designated growth area in recognition of the value of land in the ALR for agricultural purposes.

DEMOGRAPHICS

Despite the fact that the median age of this region is fairly close to the provincial median, there is a significantly smaller proportion of elderly (aged 65 and over) to working age population (aged 18 to 64) compared to British Columbia as a whole. Another interesting demographic difference is the total fertility rate, which is much higher in the Delta area compared to the provincial rate.

PROJECTIONS

Growth in this area has always been restricted due to the restrictions imposed by the ALR, so the recent agreement concerning a Livable Region Strategic Plan for the GVRD is not likely to change the pattern of growth for this area as much as it will some surrounding areas. It is still expected that this area will continue to experience positive growth rates, but more of the growth will be attributable to a strong, positive natural increase (the excess of births over deaths) than to net inflows of migrants, although the natural increase is expected to decline over time as the population ages, becoming negative by the end of the projection period.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 38: RICHMOND

Municipalities in Local Health Area:
Richmond

GENERAL ECONOMY

Richmond has a substantial residential and employment base. The economy of the area is becoming increasingly diversified with growing services and manufacturing sectors, in addition to significant agricultural and fishing sectors. Also, the Vancouver International Airport is located in Richmond and is the largest single source of employment in the area.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Richmond is not included in the Growth Concentration Area and as such, growth to the area will likely be less than it would in the absence of a regional plan.

DEMOGRAPHICS

This area has more than doubled its population over the last 25 years. It has consistently received large net inflows of migrants and the natural increase (the excess of births over deaths) has always been significantly positive. However, the total fertility rate is significantly lower than the provincial rate.

The gender ratio in this area is weighted heavily in favour of females, significantly more so than the province as a whole, which also has more females than males.

PROJECTIONS

Since Richmond is not a part of the Growth Concentration Area, it will likely grow much slower than it would in the absence of a regional plan. However, this area will continue to receive substantial inflows of migrants and growth will remain strong. If plans to build a Skytrain extension to Richmond come to fruition, there could be a significant increase in population in the region.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 39: VANCOUVER AGGREGATE

Municipalities in Local Health Area:
Vancouver

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

This area has the highest population density in the province, a thousand times the density of British Columbia as a whole. Vancouver's role as the main business centre in the province has a definite effect on its demographic make-up. The age structure is dominated by people of working age (18 to 64), with the ratio of children and elderly to working age population just under 40 per cent, compared to just under 60 per cent for the province as a whole. The fertility rate is significantly lower than the provincial rate and the median age is slightly less than the provincial median.

PROJECTIONS

Since the seventies, this area has experienced substantial growth. Vancouver's designation as part of the Growth Concentration Area should ensure that this strong growth persists. The area can continue to expect high levels of positive net migration.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

Population Projections for Local Health Areas

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 40: NEW WESTMINSTER

Municipalities in Local Health Area:
New Westminster

GENERAL ECONOMY

The Sky Train has opened up this area for residential development. The industrial base of this area has been moving to outlying areas where less expensive land is available, and this has freed up additional land for residential development. As a result, this area is becoming more of a residential suburb of Vancouver.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Since New Westminster is included in the Growth Concentration Area, it is likely that the area will experience even more growth than it would in the absence of a regional plan.

DEMOGRAPHICS

This area is one of the more densely populated areas in the province. Population growth has been fairly erratic over the last few years with net outflows alternating with net inflows, but the general trend has been toward growth.

The median age of this area is higher than the provincial median, which is reflected in the fact that the ratio of children (aged 0 to 17) over working age population (aged 18 to 64) is substantially lower than the ratio of the province as a whole.

PROJECTIONS

Due to its designation as part of the Growth Concentration Area, New Westminster is likely to experience strong, sustained growth over the projection period. Once the infrastructure is in place, migration to this area should be at levels higher than those experienced in the past, which will result in a substantial expansion of the population base.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note. All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 41: BURNABY

Municipalities in Local Health Area:
Burnaby

GENERAL ECONOMY

The Burnaby area has a substantial residential base, and a very diverse manufacturing sector, with some of the largest firms in the province. Post-secondary institutions such as Simon Fraser University and the British Columbia Institute of Technology also contribute to the area's economy.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. The Burnaby area is designated as part of the Growth Concentration Area, and as a result, growth is likely to be greater for this area than it would in absence of a regional plan. Growth will likely be focused around new Skytrain lines and the major centres these lines connect, with a wide range of housing types provided, including townhouses, apartments and single detached houses.

DEMOGRAPHICS

This area has one of the highest population densities in the province, and the population has been growing rapidly over the last decade. The median age of the population is close to the provincial median, but there are proportionately fewer children. This is in part a reflection of a significantly lower fertility rate compared to the province as a whole.

PROJECTIONS

The Burnaby area is designated as part of the Growth Concentration Area and is targeted for greater population growth than it would likely achieve in absence of a regional plan. Migration inflows to this area are expected to increase significantly, and the population will expand accordingly.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 42: MAPLE RIDGE

Municipalities in Local Health Area:
Maple Ridge, Pitt Meadows

GENERAL ECONOMY

The Maple Ridge area acts as a residential and industrial suburb of Vancouver and this role is likely to expand as transportation links to the remainder of the GVRD are improved. Forestry, mining and agriculture are all significant contributors to the economy as well. In the forest sector, manufacturing is the dominant activity with harvesting a distant second.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Maple Ridge is outside the designated Growth Concentration Area, and consequently, growth in this area will likely be less than could be expected in the absence of a regional plan.

DEMOGRAPHICS

Population growth in this area has been strong, particularly since the mid-eighties. However, the Maple Ridge area is still one of the more rural regions in the GVRD, and this is reflected in the significantly higher fertility rate and higher proportion of children in the population compared to the province as a whole. With the greater proportion of children, the median age of the population is lower than the provincial median.

PROJECTIONS

The recent agreement on a Livable Region Strategic Plan for the GVRD could limit growth to this area to some extent, but the availability of land for development should ensure strong growth nonetheless. This area also has a high, positive natural increase (i.e., the excess of births over deaths), and this will also contribute to population growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 43: COQUITLAM

Municipalities in Local Health Area:
Coquitlam, Port Coquitlam, Port Moody, Anmore, Belcarra

GENERAL ECONOMY

This area contains substantial industrial activity, but it is also becoming more of a residential suburb of Vancouver. There is a significant supply of land available for expansion and as transportation networks improve, this area should experience rapid growth.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Coquitlam is designated as part of the Growth Concentration Area and with its large supply of available land, it is one of the key areas for growth in the GVRD.

DEMOGRAPHICS

This area has experienced substantial growth over the last several years. Migration to the area has been high and increasing, but the natural increase (the excess of births over deaths) has also contributed significantly to population growth. The median age of the population is significantly younger than the provincial median and there is a significantly smaller proportion of elderly (65 and over) in this area compared to the province as a whole.

PROJECTIONS

The Coquitlam area is targeted as one of the key areas for growth in the GVRD according to the GVRD's Livable Region Strategic Plan. This area has the largest supply of available land for residential construction, and as a result, a great deal of growth is expected. It is projected that the population of this area will almost double over the next 25 years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 woman (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

(250) 387-0327

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 44: NORTH VANCOUVER

Municipalities in Local Health Area:
District of North Vancouver, North Vancouver City

GENERAL ECONOMY

This region is mainly a residential suburb of Vancouver and the surrounding areas, which means it is somewhat dependent on the economies of those regions. It is also an important shipping and rail centre, and the site of a wide range of manufacturing and service industries.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas.

DEMOGRAPHICS

Growth in this area has been somewhat erratic over the last 20 years, with alternating peaks and valleys. The median age of the population is somewhat higher than the provincial median, yet the proportion of people over the age of 65 is smaller than for the province as a whole. There are more females than males in this area, and the imbalance is significantly greater than that of British Columbia in total. The total fertility rate is substantially lower than the provincial rate and there are proportionately fewer children (17 and under) in the population.

PROJECTIONS

This area is somewhat constrained by geography and there is less room for residential expansion than in most areas in the GVRD. The Livable Region Strategic Plan could further constrain growth in this area since it is not included in the Growth Concentration Area. However, it is expected that the combination of a positive natural increase (i.e., the excess of births over deaths) and strong migration will continue to contribute to strong population growth for this area. The natural increase is expected to become negative by the end of the projection as the population ages and deaths outnumber births, but net migration will be strong enough to ensure continued population growth.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 45: WEST VANCOUVER-BOWEN ISLAND

Municipalities in Local Health Area:
Lions Bay, West Vancouver, Bowen Island

GENERAL ECONOMY

This area is primarily a residential suburb of Vancouver and the surrounding areas and most of its residents are employed in other parts of Metropolitan Vancouver.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. West Vancouver is not included in the Growth Concentration Area and it is unlikely that there will be large growth in the area because of the expense of the housing, and the improbability of high occupancy dwellings being built there.

DEMOGRAPHICS

West Vancouver-Bowen Island is the only area in the GVRD where there is a negative natural increase (i.e., the number of deaths are greater than the number of births). The fertility rate is substantially lower in this area compared to the provincial rate, and the child dependency ratio (the ratio of those aged 17 and under over those aged 18 to 64) is significantly lower than for the province as a whole. On the other hand, the elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64) is substantially higher than for the province as a whole and the median age of the population is also substantially higher than the provincial median. There is also a heavy bias in the gender ratio in favour of women. The ratio of women to men is significantly higher than for the province as a whole, which also has more women than men.

PROJECTIONS

This area is comprised mainly of single detached houses and it is unlikely that this will change. West Vancouver is not included in the Growth Concentration Area, but the regional plan is unlikely to change the pattern of growth for this area as much as it will some surrounding areas. Growth should continue at about the pace it has in the past.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 46: SUNSHINE COAST

Municipalities in Local Health Area:
Gibsons, Sechelt, Sechelt Indian Government District

GENERAL ECONOMY

Forestry is the main economic driver for this area, with two large processing facilities at Port Mellon, and considerable employment in harvesting throughout the region. The area has also become somewhat of a retirement centre. The proximity to Vancouver, combined with relatively inexpensive housing, helps draw retirees to the area.

There are plans to upgrade the ferry transportation to this region, which will make the area more accessible and could lead to further population growth. As the baby boom generation reaches retirement, regions like this one could experience a burst of population growth.

DEMOGRAPHICS

This area has generally had positive net migration, particularly in recent years. In the last 25 years the population of the region has more than doubled. Due to the status of the region as a popular place to retire, the median age of the population is substantially higher than the provincial median. The ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is significantly higher than the ratio for British Columbia as a whole. This area also has a significantly higher total fertility rate compared to the province as a whole.

PROJECTIONS

The proximity to the Lower Mainland and the promise of improvements to the transportation network bode well for population growth in this area. As the baby boom generation reaches retirement, there will likely be increasing inflows of retirees to the area. The projection is for strong, sustained population growth over the term of the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 47: POWELL RIVER

Municipalities in Local Health Area:
Powell River

GENERAL ECONOMY

Forestry-related manufacturing is the main economic driver for this area. Pacifica Papers is the primary employer in Powell River, and this area is highly dependent on the fortunes of the mill. The area is trying to diversify its economic base by developing a retirement community at Powell River. The dependence on a single major employer has resulted in significant outflows in the past when the mill underwent downsizing, and anything that would help diversify the economy would certainly be beneficial in terms of population stability.

DEMOGRAPHICS

The gender ratio of this area is weighted in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the dependence on the forest sector, which tends to be male-dominated. The median age of the population is higher than the provincial median, probably due to the efforts to attract retirees to the area.

PROJECTIONS

Although this area is attempting to diversify its economy, developments in the forest sector will continue to have important impacts. It is likely that economic cycles in the forest sector will continue to affect the employment base of the area and the net migration to this area, averaged over the long-term, is likely to be slightly negative. In the short-term, developments at the mill will likely result in population declines as layoffs occur. In addition, due to the ageing population, the natural increase (i.e., births minus deaths) is expected to become negative in the next few years. Combined with small net out-migration, this means that the population for this area will decline slowly over time.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 48: HOWE SOUND

Municipalities in Local Health Area:
Squamish, Whistler, Pemberton

GENERAL ECONOMY

Tourism and forestry are the main economic drivers for this region. Tourism is the mainstay of Whistler's economy, where an excellent skiing weekend can quadruple its population. The Whistler resort community has made efforts recently to expand its summer attractions in order to become an all-season tourist area, and this should reduce the seasonality of the resident population to some extent. The communities outside Whistler are more dependent on the forest sector.

Developments that will affect the population in this region include several tourism-related projects including the possibility of a new ski resort near Squamish that could take some of the growth pressure off Whistler.

DEMOGRAPHICS

The median age of the population in this area is substantially younger than the provincial median. The ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is much less than the provincial ratio.

There are substantially more males than females in this area, in contrast to the province as a whole, which has more women than men. As a result, since women tend to live longer than men, the median age of death is significantly lower than the provincial median. The reason for the bias is likely the influence of the male-dominated forest sector, and this bias may decline over time as the service sector grows.

PROJECTIONS

This area has one of the fastest growing populations in British Columbia. As the burgeoning tourism industry continues to supplant forestry as the main economic activity, there will likely be more stable migration patterns, and the outflows in the early eighties will likely not be seen again. As the Whistler resort expands its operations to become an all-season resort, the seasonal variation in the resident population should be reduced. The projection is for strong, sustained growth for this region.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 49: BELLA COOLA VALLEY

GENERAL ECONOMY

Forestry dominates the economy of this sparsely populated region. Harvesting is the main activity in the forest sector as there are no large processing facilities in the area. The dependence on harvesting makes this region particularly prone to reductions in the Allowable Annual Cut. The AAC for the Mid Coast Timber Supply Area was reduced in 1992 and although no further cuts were made in the short-term, it is likely that the amount of timber available for harvesting will be further reduced over the long-term.

DEMOGRAPHICS

The population in this area is largely Native. The Native population tends to be younger, on average, than non-Natives, and as a result, the median age of the population in this area is substantially younger than the provincial median. There are proportionately far more children in the population, with the ratio of children (aged 17 and under) to working age population (aged 18 to 64) significantly higher than the provincial ratio. Also, the ratio of elderly (aged 65 and over) to working age population is significantly lower than the provincial ratio. The total fertility rate is substantially higher than the corresponding provincial rate. There are more men than women in this area, in contrast to the province as a whole, where the reverse is the case.

PROJECTIONS

This area has generally experienced small net outflows of migrants in the past, and this is expected to continue to be the case. The natural increase (excess of births over deaths) should offset the out-migration for at least the next ten years, although as the population ages, the natural increase will drop and there will likely be a slight population decline over time.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 50: QUEEN CHARLOTTE

Municipalities in Local Health Area:
Masset, Port Clements

GENERAL ECONOMY

Forestry is the leading economic sector on the Islands. There are a couple of small processing facilities on the Islands, but harvesting is the main forest-based activity. Tourism and fishing are other significant industries.

A development affecting this area is the temporary reduction to the Allowable Annual Cut due to land claim issues. There have already been layoffs of loggers and more may follow if the reduction becomes permanent.

DEMOGRAPHICS

With a couple of exceptions, this area has generally experienced net migration outflows over the last 25 years. The natural increase (i.e., the excess of births over deaths) has offset the migration outflows to some extent, but in some years there have been population declines.

The gender ratio for this area is substantially weighted in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the dependence on male-dominated resource industries. Since men tend to have lower life expectancies than women, the median age at death is substantially lower than the provincial median. The overall median age is also significantly lower than for the province as a whole and this is reflected in the ratio of children (aged 17 and under) to working age population (aged 18 to 64), which is much higher than the provincial ratio, and the ratio of elderly (aged 65 and over) to working age population, which is much lower than the provincial ratio.

PROJECTIONS

This area will probably experience small net outflows over the course of the projection and a positive natural increase will likely offset any losses from migration through at least the first half of the projection period. The projection for this region, therefore, is for slow growth for most of the projection period, declining slightly near the end of the period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC Stats* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 51: SNOW COUNTRY

Municipalities in Local Health Area:
Stewart

GENERAL ECONOMY

Mining, forestry and tourism are significant economic drivers for this region. With the recent closure of the Snip Mine, the Eskay Creek Mine is the only major mine currently operating in the area, but there is potential for several other mineral projects. The Eskay Creek Mine near Stewart is one of the largest silver producers in the world. This area is high in mineral potential and several new mines are being considered, which could have significant employment impacts for the region. The most likely project is the Red Mountain Gold/Silver project near Stewart, which is currently in the Environmental Assessment Process. The Bronson Slope project, also near Stewart, is in the Environmental Assessment Process as well. With mineral prices as depressed as they are, it is unlikely that new mine construction will proceed for at least a year or two.

DEMOGRAPHICS

The ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher in this area compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is substantially lower for this area compared to the province as a whole. As a result, the median age of the population is much lower than the provincial median. The median age at death is also much younger than that of the province as a whole, and this is likely due to the greater proportion of males in the population and the fact that men tend to have lower life expectancies than women.

PROJECTIONS

The construction of new mines should provide a boost in net migration to the area. However, current metal prices make it unlikely that any of these projects will proceed for at least a couple of years. The Eskay Creek Mine will face closure during the projection period, and this will probably cause major outflows from this sparsely populated area.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 52: PRINCE RUPERT

Municipalities in Local Health Area:
Prince Rupert, Port Edward

GENERAL ECONOMY

Fishing and forestry provide the bulk of the area's economic activity. The Prince Rupert area has the largest concentration of fish processing facilities in the province outside the Vancouver region. The sea port is also an important source of employment, both in terms of trade, as well as tourism relating to the ferry and cruise ship traffic to Alaska and points south.

The Skeena Cellulose pulp mill has been bailed out by the provincial government, but it is still on shaky ground due to low prices for pulp and paper. If this mill ever goes down, it will have a devastating impact on Prince Rupert and will lead to significant out-migration. Elsewhere, the possibility of further restrictions to be imposed on the fishing industry in order to avoid depletion of salmon stocks could have serious impacts on this area, particularly considering the number of fish processing plants located in the region. Already one major processing plant has experienced significant layoffs.

DEMOGRAPHICS

The dependence on male-dominated resource industries as a source of employment is likely the reason for the significant gender bias in favour of males. This is in contrast to the province as a whole, which has more females than males. The total fertility rate for this area is substantially higher than the rate for the province as a whole. This likely contributes to the higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. In contrast, the ratio of elderly (aged 65 and over) to working age population is much lower than for the province as a whole. As a result, the median age of the population is significantly younger than the provincial median.

PROJECTIONS

This region has generally experienced net outflows of migrants and it is expected that this trend will continue, particularly if the situations in the fishing industry or at the pulp mill worsen. However, in the absence of a mill closure, the natural increase (i.e., the excess of births over deaths) should more than offset any losses due to migration, which will result in population growth for this area over the long-term.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 53: UPPER SKEENA

**Municipalities in Local Health Area:
Hazelton, New Hazelton**

GENERAL ECONOMY

Forestry is the main economic driver for this region. There are several small processing facilities in the area at Hazelton. Several of the surrounding Timber Supply Areas have endured reductions to the Allowable Annual Cut (AAC) and this could have repercussions for employment in the forest sector in this area, which could lead to some population outflows.

DEMOGRAPHICS

The ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher in this area compared to the British Columbia ratio. This may be partially due to a much higher total fertility rate compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is substantially lower for this area compared to the provincial ratio. As a result, the median age of the population is much lower than the provincial median and is in fact one of the lowest of any local health area. There are more men than women in this area in contrast to the province as a whole, which has more women than men.

PROJECTIONS

This area will likely experience small net out-migration throughout the projection period; however, a positive natural increase (i.e., the excess of births over deaths) will probably ensure that the area will continue to experience slow, steady growth.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 54: SMITHERS

Municipalities in Local Health Area:
Smithers, Houston, Telkwa

GENERAL ECONOMY

Forestry is the main economic driver in this area, although mining also plays a significant role. There are several sizeable mills in this area, at both Smithers and Houston. The recently opened Huckleberry Copper mine is the only mine currently operating in the area, but there are several prospects that may be developed. Smithers is also one of the major supply and service points for mineral exploration and development in northern British Columbia and miners working in fly-in-fly-out operations are often based there.

DEMOGRAPHICS

This dependence on the male-dominated resource industries for employment is likely the reason for a heavy bias in the gender ratio in favour of males in this area. This is in contrast to the province as a whole, which has more females than males.

The total fertility rate in this area is significantly higher than the rate of the province as a whole. This is likely partly the reason for the significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to British Columbia as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is much lower than the provincial ratio. As a result, the median age of the population is significantly younger than the provincial median.

PROJECTIONS

This region is expected to receive net inflows of migrants throughout most of the projection, with the exception of one-time events such as mine closures. The natural increase (the excess of births over deaths) for this area is relatively high and positive, and in combination with positive net migration through much of the projection period, this will result in steady population growth for this area.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:
All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 55: BURNS LAKE

**Municipalities in Local Health Area:
Burns Lake, Granisle**

GENERAL ECONOMY

This area is heavily dependent on the forest industry with about one third of residents' income derived from forest-based employment. The Babine Forest Products sawmill in Burns Lake is one of the largest in the province. Agriculture in this area consists mainly of cattle ranching due to a short growing season. Mining was a significant employer in Granisle, but since the closure of the Bell Mine in 1992 it has been less important. There is some mineral potential in the area that could be developed in the future.

DEMOGRAPHICS

Due to the dependence on the forest industry, which tends to consist of male-dominated jobs, the gender ratio for this area is heavily weighted in favour of males. This is in contrast to the province as a whole, which has more females than males. Since males tend to have a lower life expectancy than females, this also explains the significantly lower median age at death compared to the province as a whole.

The total fertility rate for this area is substantially higher than the provincial rate. This is likely one of the reasons for the significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is much lower than the provincial ratio. As a result, the median age of the population is significantly younger than the provincial median.

PROJECTIONS

The projection is for negligible migration to this area, but the positive natural increase (i.e., the excess of births over deaths) will ensure steady, positive growth in population.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 56: NECHAKO

Municipalities in Local Health Area:
Vanderhoof, Fort St. James, Fraser Lake

GENERAL ECONOMY

Forestry is by far the most dominant economic activity in this area. There are several large lumber mills spread throughout the area that provide significant employment. Mining and agriculture are also important industries in this region. This area is second only to the Peace River in terms of grain production in the province. The Endako Mine at Fraser Lake is the only major mine in the region, but there are other prospects that could be developed.

DEMOGRAPHICS

Due to the dependence on the male-dominated professions in the resource sectors, the gender ratio of this area is heavily weighted in favour of males. This contrasts with the province as a whole, which has more females than males. Since men tend to have lower life expectancies than women, the median age of death is significantly younger than the provincial median.

The total fertility rate for this area is significantly higher than the provincial rate. This is likely one of the reasons for the significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is much lower than the provincial ratio. As a result, the median age of the population is significantly younger than the provincial median.

PROJECTIONS

It is projected that net migration will be small for this area and that the natural increase (the excess of births over deaths) will more than offset any outflows that do occur. As a result, this area should have steady population growth, driven mostly by the natural increase.

Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 57: PRINCE GEORGE

Municipalities in Local Health Area:
Prince George, Mackenzie, Valemount, McBride

GENERAL ECONOMY

Forestry is by far the main economic driver for this region, with tourism playing a lesser, though still significant, role. Prince George is the main service centre of the northern interior of the province and the service sector is particularly important to the city's economy. Positioned as it is at the junction to the North to Alaska, the South to Vancouver, the East to Alberta and the West to Prince Rupert, Prince George experiences a great deal of tourist activity.

Developments in the forest sector will likely drive growth in this region in the future. This area is home to a large number of pulp mills and sawmills and it is crucial that the timber supply to this area is sustained if it is to maintain its job base. There have been a couple of mill closures in the last couple of years in this area and there will likely be some population impacts as a result.

DEMOGRAPHICS

The downturn in the forest sector in the mid-eighties was responsible for much of the net out-migration from the area at that time. In the mid-nineties the area received large net inflows of migrants. Some of this may be due to the construction of the University of Northern British Columbia in Prince George.

The median age of the population in this area is significantly lower than the provincial median, and this is reflected in the ratio of children (aged 17 and under) to working age population (aged 18 to 64), which is higher than the provincial ratio. Conversely the ratio of elderly (aged 65 and over) to working age population is significantly lower than the provincial ratio. The dependence on the forest sector and the male-dominated employment in the industry is likely the reason for the gender ratio that is weighted in favour of males.

PROJECTIONS

Although forestry is the main economic driver, the economy of this area is sufficiently diversified such that it can expect to continue to receive net migration inflows over most of the projection period with the exception of the next year or so. The natural increase (excess of births over deaths) is expected to be positive as well, which means the area will continue to experience strong, positive growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 59: PEACE RIVER SOUTH

Municipalities in Local Health Area:
Dawson Creek, Chetwynd, Tumbler Ridge, Pouce Coupe

GENERAL ECONOMY

Mining and forestry are the main economic drivers for this area, but agriculture and oil and gas exploration are also significant. There are two major coal mines in the area (Bullmoose and Quintette) that supply coal to Japanese markets and potential for further coal projects exists.

A major development that will affect this region is the closure of the Quintette coal mine in August, 2000 and the likely closure of the Bullmoose coal mine in 2003. These mines have already experienced significant layoffs in the last two years. There have already been some population impacts from the layoffs and more are certain to follow.

DEMOGRAPHICS

Due to the dependence on the mining and forestry sectors, which tend to have male-dominated employment, the gender ratio for this area is weighted in favour of males. This is in contrast to the province as a whole, where there are more females than males.

The total fertility rate is significantly higher in this area, and could partially explain the significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. As a result, the median age of the population is significantly lower than the provincial median.

PROJECTIONS

The increased activity in the oil and gas industry should result in some growth for this region, although it will be overshadowed in the short-term by the layoffs at the coal mines, which could result in out-migration for the next several years. The long-term growth combined with a positive natural increase (the excess of births over deaths) will result in steady growth for the area in the long-term.

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 60: PEACE RIVER NORTH

Municipalities in Local Health Area:
Fort St. John, Hudson's Hope, Taylor

GENERAL ECONOMY

The main economic drivers in this area are oil and gas exploration, forestry, tourism and agriculture. The North-eastern region of the province is a significant producer of oil and gas, and exploration in this sector has and will continue to employ a significant number of people.

Developments that could affect this area include the possibility of several new mills including two oriented-strandboard mills, and the potential for several new energy projects. In the short-term, there are several smaller projects that will provide a great deal of construction employment, and subsequently, will draw people into the area, at least for the duration of construction.

DEMOGRAPHICS

Due to the economic dependence on resource sectors, which tend to have male-dominated employment, the gender ratio for this area is weighted in favour of males. This is in contrast to the province as a whole, where there are more females than males.

The total fertility rate is significantly higher in this area, and could partially explain the significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is significantly lower. As a result, the median age of the population is significantly lower than the provincial median.

PROJECTIONS

The proposed energy projects should result in a boost to the net in-migration to this area in the short-term. If the mills go ahead, there should be significant in-migration to this area. The natural increase (excess of births over deaths) should remain positive, which, in combination with positive migration, will result in steady growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 61: GREATER VICTORIA

Municipalities in Local Health Area:
Victoria, Oak Bay, Esquimalt, View Royal, Saanich (portion)

GENERAL ECONOMY

Victoria's status as the provincial capital means that the bulk of the government sector is located within Greater Victoria. As a result, the public sector is an important economic driver for this area. The pleasant climate of the area also makes it a popular tourist destination and retirement area. The abundance of retirees makes pension and investment income important elements of the economy. This, in combination with a large tourism trade, helps to drive the service sector.

The tourism sector received a significant boost with the exposure given the city from the Commonwealth Games, and this sector is expected to continue to flourish in the future.

DEMOGRAPHICS

This area has traditionally experienced net inflows of migrants, even when other parts of the province were subjected to net outflows with the exception of the last couple of years. The urban nature of the area means that the population density is much greater than the provincial average. The median age of the area's population is significantly higher than the provincial median, due to the area's status as a retirement centre.

The larger percentage of elderly people affects other demographic variables as well. For example, the gender ratio is weighted much more in favour of females than is the case for British Columbia as a whole, since females tend to live longer than males.

PROJECTIONS

Migration to this area has been consistently high and this is likely to remain the case over the projection period. The natural increase is negative for this area (i.e., the number of deaths exceeds the number of births) and this will likely continue over the projection period, although the large migration inflows will more than compensate for any declines from the negative natural increase. Population growth should continue to be strong, particularly as the provincial population ages and more people chose to retire in the area.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 62: SOOKE

Municipalities in Local Health Area:
Colwood, Metchosin, Langford, Highlands, Sooke

GENERAL ECONOMY

The portion of this area that borders on Victoria acts mainly as a residential suburb, but the communities on the west coast of the Island are largely dependent on the forest sector. Most of the activity in the forest sector involves harvesting, although there are some small sawmills clustered throughout the area.

Major developments that could affect this area include the recent construction of sewer lines and the improved transportation networks to the Sooke area. These developments could be an indication that this area may be ready for more serious development.

DEMOGRAPHICS

Most of the population growth in this area in the last several years has been due to population spill over from Victoria. New incorporations of Langford, Highlands and Sooke have resulted from the rapid growth.

The gender ratio in this area is weighted in favour of males, in contrast to the province as a whole, where there are more women than there are men. The ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher in this area compared to the provincial ratio. This is partly due to a higher fertility rate compared to the provincial rate.

PROJECTIONS

This area has a substantial supply of land available for residential development, and as transportation networks to the area improve and the necessary infrastructure is put in place, this area should experience strong growth. The construction of the sewer lines is the first step toward significant development in this region and should lead to rapid expansion. It is projected that the population of this area will double over the next 25 years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 63: SAANICH

Municipalities in Local Health Area:
North Saanich, Central Saanich, Sidney, Saanich (portion)

GENERAL ECONOMY

This area serves mainly as a residential suburb to Victoria, and as a result, is highly dependent on the economic activities in Greater Victoria. There is also some agricultural activity in the area. The existence of good transportation links to Victoria and the availability of developable land will ensure continued high growth for this area.

DEMOGRAPHICS

This area has traditionally experienced net inflows of migrants, even when other parts of the province were subjected to net outflows with the exception of last year. The urban nature of the area means that the population density is much greater than the provincial average. The median age of the area's population is significantly higher than the provincial median, due to the large concentration of retirees.

The larger percentage of elderly people affects other demographic variables as well. For example, the gender ratio is weighted more in favour of females than is the case for British Columbia as a whole, since females tend to live longer than males.

PROJECTIONS

The Saanich area has been benefiting from spin-off growth from Victoria and this should continue for some time. However, eventually the availability of land will slacken and growth will move more into the Sooke area. Population growth should continue to be strong throughout the projection period, though waning over time.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 64: GULF ISLANDS

GENERAL ECONOMY

The main economic drivers of this area are tourism and servicing the large retirement community. The character of the area and its scenic beauty make it a popular choice for retirees and tourists alike; however, residents would prefer to limit growth in the area so that its character can be maintained. To this end an "Island Trust" has been established to control development and keep it in line with what the residents feel is suitable.

DEMOGRAPHICS

The median age of the population is substantially higher than the provincial median due to the area's status as a retirement centre. The larger percentage of elderly people affects other demographic variables as well. For example, the gender ratio is weighted more in favour of females than is the case for British Columbia as a whole, since females tend to live longer than males. The elderly dependency ratio (the ratio of those aged 65 and over to those aged 18 to 64) is substantially higher than the provincial ratio.

PROJECTIONS

The Gulf Islands' "Island Trust" exists to ensure that the Islands maintain their character and this control over development will likely keep growth on the Islands to a minimum. That character is also what attracts migrants to the Islands, so there should continue to be growth to the extent that the current residents allow. Some of the migration will be offset by a negative natural increase (i.e., a greater number of deaths than births) resulting from the more mature age structure.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 65: COWICHAN

Municipalities in Local Health Area:
Duncan, North Cowichan

GENERAL ECONOMY

Forestry is the main economic driver of the Cowichan area. This includes logging, lumber milling and pulp and paper manufacturing. Services catering to the retirement community are also growing as a part of the economy.

This area benefits from its location between the Capital and Nanaimo regions and has received significant spin-off growth as a result. The significant economic dependence on forestry makes the area vulnerable to downturns in the forest sector, but although forestry is the main economic driver, the economy of the area is reasonably diversified and this should help the area maintain stability.

DEMOGRAPHICS

This region suffered some migration losses in the mid-eighties due to the downturn in the forest sector, but has had strong, positive migration otherwise. Due to a growing retirement community, the median age of the population has been getting older and has surpassed the British Columbia median age. The elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is significantly higher in this region than for the province as a whole, but the child dependency ratio (i.e., the ratio of those aged 17 and under to those aged 18 to 64) is also significantly higher than the provincial ratio. This is partly the result of a substantially higher fertility rate for this area compared to the province as a whole.

PROJECTIONS

This area has benefited from spin-off growth from both Victoria and Nanaimo and will likely continue to do so. It is projected that net migration will continue to be strong for this area, and as a result, the population should continue to expand.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 66: LAKE COWICHAN

Municipalities in Local Health Area:
Lake Cowichan

GENERAL ECONOMY

This area is highly dependent on forestry. The forest industry in this region includes both harvesting and processing. Tourism is another important economic activity, but it is dwarfed in importance by the forest industry.

The dependence on the forest industry makes this area susceptible to fluctuations in the forest sector. Reductions to the Allowable Annual Cut are a concern for this area. The Arrowsmith Timber Supply Area, in which Lake Cowichan is situated, and Tree Farm Licenses in the area have experienced reductions to the AAC recently. These reductions could lead to job loss and if further reductions are made and they are deep enough, threshold levels could be reached where area mills may have to shut down. The mill at Youbou is up for sale and it is possible the new owners may close the mill and use the timber allocated to the mill to supply another mill.

DEMOGRAPHICS

This area was traditionally a net loser of migrants prior to 1990. More recently there has been positive net migration, probably as a result of spin-offs from the strong growth in the surrounding areas.

The gender ratio for this area is heavily weighted in favour of males, in contrast to the province as a whole, where there are more females than males. This is likely due to the nature of the economy and the dependence on forest sector jobs, which tend to be male-dominated.

PROJECTIONS

It is not anticipated that the recent strong net migration will continue for this area, particularly since the forest sector, which is the dominant sector in the economy, is facing fibre supply constraints. It is more likely that inflows and outflows will more or less net out and the population will remain fairly constant over the long-term, perhaps increasing slightly.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 67: LADYSMITH

Municipalities in Local Health Area:
Ladysmith

GENERAL ECONOMY

This area is highly dependent on forestry. There are a few large processing facilities in the region that provide significant numbers of employment. Tourism is another important economic activity, but to a far lesser extent than the forest industry.

The dependence on the forest industry makes this area susceptible to fluctuations in the forest sector. Reductions to the Allowable Annual Cut are a concern for this area. Further cuts could cause supply shortages for area mills that could force shutdowns.

DEMOGRAPHICS

Like many resource dependent areas in the province, this area suffered migration losses in the mid-eighties and also in the last couple of years, but when the forest sector has been healthy, the area generally experienced migration gains.

The median age of the population is higher in this area compared to the province as a whole, due to the large presence of retirees. There are also proportionately more children in the area, and this is due, at least in part, to the substantially higher fertility rate compared to the rate for the province as a whole.

PROJECTIONS

This area has benefited from spin-off growth from both Victoria and Nanaimo and will likely continue to do so. It is projected that net migration will continue to be strong for this area, and as a result, the population should continue to expand.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

Population Extrapolation for Organizational Planning with Less Error

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 68: NANAIMO

Municipalities in Local Health Area:
Nanaimo

GENERAL ECONOMY

Forestry is the primary economic driver in this region. The forest sector includes logging, lumber milling, veneer production, and pulp manufacturing. In addition to forestry, the service sector is an important segment of the economy. The City of Nanaimo is the main service and distribution centre for central Vancouver Island. In addition, the ferry link to the Lower Mainland also attracts business for the service industries. Some people commute from Nanaimo to the Lower Mainland as well.

DEMOGRAPHICS

This area has experienced strong population growth over the last decade, and managed to escape most of the net out-migration that occurred in many resource dependent areas in the mid-eighties and in the last couple of years. The population of this area has more than doubled in the last 25 years.

The median age of the population is higher in this area than the provincial median and there is a higher proportion of people over the age of 65. The area's role as a service centre is likely the reason for a gender ratio that favours females, unlike neighbouring regions that are more dependent on the forest sector and the male-dominated jobs within that sector.

PROJECTIONS

Nanaimo's role as service centre for the central Island should ensure that it continues to experience strong growth. It is projected that recent strong, positive net migration will persist in this area and it will continue to expand rapidly, growing in population by over 60 per cent over the next 25 years.

Date run: Prepared for: Enquiries:	May 18, 2000. Ministry of Finance and Corporate Relations. Population Section, BC STATS Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:

All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 69: QUALICUM

Municipalities in Local Health Area:
Parksville, Qualicum Beach

GENERAL ECONOMY

Forestry is the primary economic driver in this region. The forest sector is comprised mainly of logging, as there are no permanent large processing facilities in the area. In addition to forestry, the service sector is an important segment of the economy. The Qualicum area is a growing retirement centre, which helps drive the service sector.

There is a great deal of residential construction currently underway in this area and more projects are planned. This is a reflection of the strong population growth experienced recently in this region.

DEMOGRAPHICS

Due to the area's role as a retirement centre, the median age of the population is well above the provincial median. The ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is substantially higher in this area compared to the province as a whole. The larger percentage of elderly people affects other demographic variables as well. For example, the gender ratio is weighted more in favour of females than is the case for British Columbia as a whole, since females tend to live longer than males.

PROJECTIONS

The ageing population means that the already negative natural increase (i.e., the number of deaths exceed the number of births) will fall even further. At the same time, its popularity as a retirement centre will ensure that migrants continue to move to the area, particularly as the baby boom generation begins to reach retirement age. The projection is for continued strong, positive net migration, more than offsetting the negative natural increase, and resulting in strong population growth over the period of the projection.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 70: ALBERNI

Municipalities in Local Health Area:
Port Alberni, Ucluelet, Tofino

GENERAL ECONOMY

Forestry is the primary economic activity in this region, and as a result, the area is vulnerable to fluctuations in this sector. Fishing is another important resource-based industry in the region. The resource-based sectors have been experiencing supply problems in recent years, which has precipitated a push for growth in the tourism sector.

Developments in the forest sector are having a significant effect on this area. Reductions to the Allowable Annual Cut have reduced employment in harvesting and there have also been cutbacks at local mills. In the fishing industry, low levels of fish stocks could lead to restrictions on the size of the catch and the length of the fishing season, which could seriously affect the industry. On the positive side, projects in the tourism sector like the Reef Point resort at Ucluelet should help mitigate some of the effects of the downturn in the resource sectors.

DEMOGRAPHICS

This region has generally been a net loser of migrants and the trend is expected to continue as the economy is transformed from resource-based industries to more service-oriented industries.

The gender ratio for this region is weighted in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the nature of the economy and the dependence on resource-based employment, which tends to be male-dominated. The proportion of elderly people (over 65 years of age) has increased to the point where it is similar to that of the province as a whole.

PROJECTIONS

It is projected that the traditional net migration outflows for this area will continue, particularly as constraints in the resource sectors reduce the employment base. Although there are plans to further develop the tourist industry and to attract more retirees to the region, the number of jobs in the service sector supported by these activities is significantly less than those supported by the forest sector. This means that it will take more than one tourism job to achieve the same spin-off benefits of one forest job. The end result should be a slight population decline for the area.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 71: COURTENAY

Municipalities in Local Health Area:
Courtenay, Comox, Cumberland

GENERAL ECONOMY

The economy of this area is highly diversified. Forestry is the main economic driver, but the Canadian Forces Base at Comox, tourism, fishing, agriculture and services are all significant employers as well. The fishing industry includes both commercial and sport fisheries. Besides sport fishing, other tourist attractions include the Mount Washington and Forbidden Plateau ski hills. In addition to the business created by the tourism industry, the large retirement community in the area also drives the service sector.

Developments that will affect this area include reductions to the Allowable Annual Cut and the completion of the Island Highway. The reductions to the AAC could result in significant job loss in the forest sector; however, the diversification of the economy in this area will ensure that the population effects will be minimal. In addition, the completion of the Island Highway could have a significant impact on this area in terms of increased tourist traffic, as well as an increase in commuters and shoppers from nearby areas.

DEMOGRAPHICS

This area was one of the fastest growing areas in the province in the last decade. The population has almost doubled in the last 20 years. Strong net migration is the main driver of the growth, although the natural increase (the excess of births over deaths) has been significant as well.

The median age of the population in this area is higher than the provincial median, and there is a slightly higher proportion of people over the age of 65 in this area compared to the province as a whole. However, there are also proportionately more children (aged 17 and under), partially due to a significantly higher fertility rate compared to the province as a whole.

PROJECTIONS

Migration to this area has slowed considerably in the last couple of years and although it is expected to pick up again, it is projected that migration to this area will occur at a more moderate rate compared to the mid-nineties. However, growth will still be strong and steady.

Prepared by:	Population Section, BC STATS, Ministry of Finance and Corporate Relations, Government of the Province of British Columbia, Using P.E.O.P.L.E. Projection Model, Projection 25.	Date run: Prepared for: Enquiries:	May 18, 2000. Ministry of Finance and Corporate Relations. Population Section, BC STATS Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:

All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 72: CAMPBELL RIVER

Municipalities in Local Health Area:
Campbell River, Sayward

GENERAL ECONOMY

The forest sector is the main economic driver for this area, but mining, tourism, fishing and services are all significant industries as well, providing the area with a well-diversified economy. There are two major mines in the area, both near Campbell River: the Myra Falls Mine, and the Quinsam Coal Mine. The fishing industry includes both commercial and sport fisheries.

Developments that could affect the population of this region include the reductions to the Allowable Annual Cuts of timber licenses in the area, and the closure of the mines some time during the projection. The AAC reductions could have a significant impact on the smaller centres in this region, and further reductions over time will likely lead to population outflows. The mines are not scheduled to close for some time, but when they do, there will likely be a significant population impact. The Quinsam mine has experienced some major layoffs in the last year and there may be population impacts as a result.

DEMOGRAPHICS

The gender ratio in this area is heavily weighted in favour of males, in contrast to the province as a whole, which has more females than males. The reason for the gender imbalance is probably the nature of the economic activity in the area. There is a dependence on resource sector activities that are male-dominated professions. The median age of the population of this region is slightly younger than the provincial median. There are proportionately more children (17 and under) in this area compared to the province as a whole and the ratio of elderly (65 and over) to working age population (aged 18 to 64) is significantly lower than the provincial ratio.

PROJECTIONS

The diversified economy of this area should protect it from any volatility in the resource sectors. As a result, it is likely that the net migration to Campbell River should remain strong and positive. In addition, the younger age profile of the area should ensure that the number of births exceeds the number of deaths, and therefore the natural increase (excess of births over deaths) will also contribute to growth, at least until near the end of the projection period. The projection is for steady growth for this area over the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

(250) 387-0327

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 75: MISSION

Municipalities in Local Health Area:
Mission

GENERAL ECONOMY

Due to its proximity to the GVRD, this area serves as a residential and industrial suburb of that region. In addition, forestry is a major economic driver for the Mission area.

A development affecting this region is the recent reduction in the Allowable Annual Cut of the Fraser Timber Supply Area, in which the Mission LHA is situated, which could result in some job loss. However, since most of the forest-based employment for this area is in manufacturing, rather than harvesting, it is unlikely that the job impacts from the AAC reduction will be significant, unless area mills have supply problems and are forced to either down-size or shut down altogether.

DEMOGRAPHICS

There are proportionately fewer elderly people living in this area than compared to the province as a whole. As a result, the median age is lower than the provincial median. On the other hand, there are proportionately more children in the area and this is partly a reflection of a substantially higher fertility rate compared to the provincial rate. The gender ratio for this area is heavily biased in favour of males, in contrast to the province as a whole, where there are more females than males.

PROJECTIONS

The Mission area has a great deal of land available for development and is not constrained as much as other areas in the Fraser Valley Regional District in terms of how much of the land is reserved for agricultural use. As a result, this area will likely experience significant growth in the next 20 to 30 years.

Prepared by Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327

Note All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 76: AGASSIZ-HARRISON

Municipalities in Local Health Area:
Harrison Hot Springs, Kent

GENERAL ECONOMY

Tourism, forestry and agriculture are the main economic drivers of this area. The Harrison Hot Springs resort is the centre of the tourist trade, while agriculture is concentrated within the District of Kent. Forestry is an important economic activity throughout the region.

The recent reduction of the Allowable Annual Cut for the Fraser Timber Supply Area, in which the Agassiz-Harrison LHA is situated, could have a negative effect on the employment base of the area. The AAC has been reduced by 28 percent since 1995 and the reduction will likely lead to significant job loss in the harvesting sector in this area.

DEMOGRAPHICS

The gender ratio in this area is extremely biased in favour of males with about five men for every four women. This is in contrast to the province as a whole, where there are more women than men. Men tend to have a shorter life expectancy than women, and the male bias is evident in the median age of death as well, which is substantially younger than the British Columbia median.

Like the rest of the Fraser Valley, this area has a fertility rate that is significantly higher than the provincial rate. This is reflected in the higher proportion of children in the population compared to the province as a whole.

PROJECTIONS

This area has generally experienced positive net migration and there is little reason to believe that this will not continue to be the case over the projection period. In recent years the area experienced rapid growth, but it is projected that growth will return to more historical levels and the area will have slow, but positive growth over the length of the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 77: SUMMERLAND

Municipalities in Local Health Area:
Summerland

GENERAL ECONOMY

This area is mainly a retirement centre, but agriculture and tourism are also important sectors in the economy. A federal agriculture research centre and some packing and processing facilities at Summerland are major employers in the area. The large retirement community and the tourist trade support the service sector.

DEMOGRAPHICS

Due to its role as a retirement centre, the median age of the population in this area is substantially higher than the provincial median. Also, the gender ratio is much more biased in favour of females than it is for the province as a whole. As a result, the median age at death is also significantly higher than the provincial median (since women generally have a longer life expectancy than men).

The overall number of "dependants" as a ratio to the working age population (aged 18 to 64) is far higher in this area than for the province as a whole. The dependent population (children 17 and under, and elderly 65 and over) is almost 85 per cent the size of the working age population. This is compared to less than 55 per cent for British Columbia. Most of the difference is due to the proportionately larger elderly population.

PROJECTIONS

This area has been experiencing strong growth and the stability of the agricultural sector and retirement-based services should ensure continued strong growth in the future. The net inflows of migrants should more than compensate for losses due to a negative natural increase (i.e., the number of deaths exceeding the number of births).

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

LOCAL HEALTH AREA 78: ENDERBY

Municipalities in Local Health Area:
Enderby

GENERAL ECONOMY

Forestry and agriculture are the main economic activities in this area. The agricultural sector is composed of many diverse activities, reflecting the transition between climactic zones within the area. Crops range from grain to fruits and vegetables, and cattle ranching is also significant.

DEMOGRAPHICS

Through most of the eighties, this area experienced net migration outflows. This was likely due to the downturn in the forest sector. Since that time, migration has been fairly strong into the area, as it has been throughout most of the Okanagan region. The population of this area has doubled over the last 25 years.

The gender ratio for this area is weighted slightly in favour of males, in contrast to the province as a whole, which has more females than males. This is likely due to the male-dominated jobs in the forest sector. The total dependency ratio (i.e., the ratio of children 17 and under plus elderly 65 and over to the working age population 18 to 64) is substantially higher, at over 65 per cent, than the provincial ratio, which is around 55 per cent.

PROJECTIONS

This is one of the less densely populous areas in the Okanagan region, and although it has experienced strong growth along with the rest of the region, the growth has been smaller in relative terms than other Okanagan areas. Nevertheless, this area will likely continue to receive net inflows of migrants and is projected to experience steady growth throughout most of the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Figures for the period 2000-2026 are projected

Note: All figures as of July 1.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 80: KITIMAT

Municipalities in Local Health Area:
Kitimat

GENERAL ECONOMY

The Alcan aluminum smelter is the most significant employer in the Kitimat area. The smelter employs almost 2,000 people at its Kitimat operations and as a result, is the foremost economic driver in the area. The Alcan smelter is the largest aluminum smelter in Canada outside Quebec. Forestry also has major significance for the area, particularly with the large pulp and paper mill in Kitimat.

Alcan has come to an agreement with the provincial government over compensation for the Kemano Completion Project that was cancelled by the government over environmental concerns. The deal could lead to the construction of a second aluminum smelter in Kitimat, which would provide a large boost to employment and would likely have a significant population effect.

DEMOGRAPHICS

The gender ratio for this area is heavily weighted in favour of males, in contrast to the province as a whole, which has more women than men. This is likely due to the predominance of male-dominated professions in the area. The male bias is partially the reason for the significantly younger median age of death compared to the province as a whole, since men tend to have lower life expectations than women. The median age of the population is significantly younger than the provincial median and this is reflected in both the child dependency and elderly dependency ratios. The child dependency ratio (i.e., the ratio of those aged 17 and under to those aged 18 to 64) is significantly higher than the provincial ratio. At the same time, the elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is substantially lower than the provincial ratio.

PROJECTIONS

Growth in this area has been erratic in recent years, with population declines alternating with small increases such that the population has remained virtually static over the last 15 years. However, the aluminum smelter will result in significant in-migration if it proceeds.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.

Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 81: FORT NELSON

Municipalities in Local Health Area:
Fort Nelson

GENERAL ECONOMY

Forestry, tourism and oil and gas exploration are the major economic drivers for this region. There are two large processing facilities located in Fort Nelson that employ close to 600 people between them. The North-eastern region of the province is a significant producer of oil and gas and exploration in this sector has and will continue to employ a significant number of people.

DEMOGRAPHICS

The economic dependence on the resource sectors and the male-dominant employment in these sectors is the main reason for the heavy weighting of males in the population in this area, in contrast to the province as a whole, which has more women than men. The remoteness of the area is likely the reason why the median age of the population is far lower than the provincial median. The total fertility rate is substantially higher than the provincial rate, and is likely partially the reason for a significantly higher ratio of children (aged 17 and under) to working age population (aged 18 to 64) compared to the province as a whole. There is a very small proportion of elderly in the population compared to British Columbia as a whole.

PROJECTIONS

The natural increase (i.e., the excess of births over deaths) will contribute between 60 and 95 people per year to the population base of this area. At the same time, it is expected that the area will experience small, positive net migration over most of the projection period. As a result, this area should experience strong population growth.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next higher age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 83: CENTRAL COAST

GENERAL ECONOMY

Forestry and fishing dominate the economy of this sparsely populated region. Harvesting is the main activity in the forest sector as there are no large processing facilities in the area. The dependence on harvesting makes this region particularly prone to reductions in the Allowable Annual Cut. The AAC for the Mid Coast Timber Supply Area was reduced in 1992 and although no further cuts were made in the short-term, it is likely that the amount of timber available for harvesting will be further reduced over the long-term.

DEMOGRAPHICS

The population in this area is largely Native. The Native population tends to be younger, on average, than non-Natives, and as a result, the median age of the population in this area is substantially younger than the provincial median. There are proportionately far more children in the population, with the ratio of children (aged 17 and under) to working age population (aged 18 to 64) significantly higher than the provincial ratio. Also, the ratio of elderly (aged 65 and over) to working age population is significantly lower than the provincial ratio.

There are more men than women in this area, in contrast to the province as a whole, where the reverse is the case. The median age of death is substantially younger than for the province as a whole, and this is partly due to this gender bias in favour of men, who tend to have lower life expectancies than women, and partly due to the concentration of Natives, who tend to have lower life expectancies than non-Natives.

PROJECTIONS

This area has generally experienced small net outflows of migrants in the past, and this is expected to continue to be the case. The natural increase (excess of births over deaths) should offset the out-migration for the most part, which means the population should remain fairly stagnant through most of the projection period, growing slightly over time.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates
Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 84: VANCOUVER ISLAND WEST

Municipalities in Local Health Area:
Gold River, Tahsis

GENERAL ECONOMY

Forestry is by far the main economic driver for this area, responsible for approximately 70 percent of the after-tax income in the area. The forest sector includes both harvesting and processing activities. Area mills are a crucial source of employment for residents.

The most important development affecting this area is the closure of the pulp mill at Gold River. This will have a devastating impact on the town of Gold River as well as the area as a whole. The region has already experienced significant out-migration due to the mill closure and more could follow. The sawmill at Tahsis is also a concern due to supply problems and if it shuts down, there will be further out-migration from the area.

DEMOGRAPHICS

There is a large imbalance in the gender ratio of this area in terms of males, in contrast to the province as a whole, where there are more females than males. The disparity is likely due to the nature of the forest-based economy and the fact that forestry jobs tend to be male-dominated. The population is also substantially younger, with a median age much less than the provincial median. The ratio of children (17 and under) to working age population (18 to 64) is significantly higher than the provincial ratio, while the ratio of elderly (65 and over) to working age population is substantially lower. The median age of death is significantly lower in this area compared to the province as a whole. This could be due, in part, to the gender imbalance and the fact that women tend to live longer than men.

PROJECTIONS

The problems in the forest sector are likely to have serious repercussions for this area. It is likely that in the first couple of years of the projection there will be massive out-migration from the closure of the pulp mill at Gold River, and further outflows could occur if the forest sector continues to struggle in this area. The area will likely experience population declines over the next few years.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note

All figures as of July 1.
Child Dep = Pop(0-17) / Pop(18-64)
Elderly Dep = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 85: VANCOUVER ISLAND NORTH

Municipalities in Local Health Area:
Port Hardy, Port McNeil, Port Alice, Alert Bay, Zeballos

GENERAL ECONOMY

Forestry is by far the most important economic activity in this region, although fishing and tourism also play significant roles. The forest sector is dominated by logging activity, and also the pulp mill at Port Alice.

Developments in the resource sectors will likely determine the amount and direction of population growth in this area. The downturn in the forest sector, reductions to the commercial fishing fleet and downsizing by the Federal government have hurt this region and out-migration has resulted.

DEMOGRAPHICS

The dependence on the male-dominated professions in the resource sectors is the reason for the heavy weighting of the gender ratio in favour of males in this area, in contrast to the province as a whole, where there are more females than males. Since women tend to live longer than men, this partially explains the substantially younger median age at death compared to the province as a whole.

The median age of the population is also substantially younger than the provincial median and this is reflected in the child and elderly dependency ratios. The child dependency ratio (i.e., the ratio of those aged 17 and under to those aged 18 to 64) is significantly higher than the provincial ratio, while the elderly dependency ratio (i.e., the ratio of those aged 65 and over to those aged 18 to 64) is substantially lower than the provincial ratio.

PROJECTIONS

The long-term outlook for this region is for consistent net migration outflows. The natural increase (the excess of births over deaths) will offset the migration outflows for part of the projection period, but as the population ages and the natural increase declines, there will be some population decline.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 87: STIKINE

GENERAL ECONOMY

Mining, tourism and forestry are all important contributors to the economy in this region. In the forest sector, the threefold increase to the Allowable Annual Cut (AAC) of the Cassiar Timber Supply Area could have significantly positive repercussions for this area, and could result in relatively large inflows of population, particularly if a large processing facility is built. Even in the absence of the processing facility, the road construction that would have to coincide with the harvesting would open up the area and increase the potential for new mines and new communities.

In the mineral sector, there are plans to construct a magnesium plant at Cassiar that would employ 2,500 in construction and 1,000 in operation, with start-up around 2003. If this facility proceeds, there could be an explosion of growth for this sparsely populated area. *Due to the potential of a threefold increase in population and the uncertainty at this time as to whether or not the plant will proceed, this projection includes an alternate scenario for this region only that includes this project (the base scenario assumes the project will not proceed).*

DEMOGRAPHICS

This area is sparsely populated and this results in rather erratic demographic statistics. However, the remoteness of the area means that the age structure of the population is consistently younger than that of the province as a whole. The median age is significantly lower than the provincial median, and the ratio of elderly (aged 65 and over) to working age population (aged 18 to 64) is significantly lower than the ratio for the province as a whole. Another consistent statistic is that the gender ratio is heavily weighted in favour of males, in contrast to the province as a whole, which has more females than males.

PROJECTIONS

The population in this area could explode if the smelter goes ahead, but even if the smelter is not built, developments in the forest sector should lead to substantial population growth for this area. Most of this increase will be driven by net inflows of migrants, drawn to the area by the increase in employment opportunities resulting from the increased AAC.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 88: TERRACE

Municipalities in Local Health Area:
Terrace

GENERAL ECONOMY

Forestry and tourism are significant economic drivers for this region. There are several processing facilities in the area, including two large mills at Terrace. Recently, the mills have had problems with profitability and there is the possibility that they could be permanently closed if the situation in the forest sector does not improve significantly.

The retail sector in Terrace could benefit significantly if the aluminum smelter project goes ahead in Kitimat. This would help mitigate any losses in the forest sector.

DEMOGRAPHICS

The ratio of children (aged 17 and under) to working age population (aged 18 to 64) is significantly higher in this area compared to the province as a whole. Conversely, the ratio of elderly (aged 65 and over) to working age population is substantially lower for this area compared to the province as a whole. As a result, the median age of the population is much lower than the provincial median. The median age at death is also much younger than that of the province as a whole, and this is likely due to the greater proportion of males in the population and the fact that men tend to have lower life expectancies than women.

PROJECTIONS

The problems in the forest sector could have a negative impact on migration. Low prices for pulpwood are forcing closures of mills in the area and unless the situation is rectified soon, it could result in significant population impacts for the area. Spin-off benefits from major projects in Kitimat could help mitigate losses in the forest sector.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 92: NISGA'A

GENERAL ECONOMY

The main economic driver in this area is forestry. The forest sector is basically restricted to harvesting, with no major processing facilities in the area. Wood harvested from this area supplies mills in Terrace and Prince Rupert.

The recent Nisga'a land claims settlement should have a major impact on this area. In the past the Nisga'a have been reluctant to make long-term investments in the forest sector, but now they will have more control over how the resource will be handled and the Nisga'a plan to develop their own value-added industry. This could result in a significant increase in the employment base for this area.

DEMOGRAPHICS

The population of this area is mostly Native. As with the Aboriginal population throughout British Columbia, the population has demographic characteristics quite distinct from the provincial averages. These include a much younger median age, a total fertility rate that is substantially higher than the provincial rate, a much younger median age of death, and a very large proportion of children in the population. There are also substantially more males in the population than females.

PROJECTIONS

The Nisga'a land claims settlement will have a substantial impact on the future of this area. It is likely that with increased control over the forest sector and the desire of the Nisga'a to expand the industry with more value-added operations, the employment base of this region will increase such that it will be better able to retain much of its younger population who, in the past, were likely to move on to more urban areas. As a result, migration outflows will be smaller and this, in combination with a positive natural increase (i.e., the excess of births over deaths), should lead to slow, steady growth for the area.

Prepared by:	Population Section, BC STATS, Ministry of Finance and Corporate Relations, Government of the Province of British Columbia, Using P.E.O.P.L.E. Projection Model, Projection 25.	Date run:	May 18, 2000.
		Prepared for:	Ministry of Finance and Corporate Relations.
		Enquiries:	Population Section, BC STATS Ministry of Finance and Corporate Relations, (250) 387-0327.

Note:

All figures as of July 1.

Child Dep. = Pop(0-17) / Pop(18-64)

Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households

Crude Dth Rate = Calendar year death estimates per 1000 population

TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Sex Ratio = Males per 100 females

Figures for the period 2000-2026 are projected.

Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 94: TELEGRAPH CREEK

GENERAL ECONOMY

Mining and forestry are the main economic drivers in this area. The seasonal Golden Bear Mine is the only major mine in this area, but there is a lot of mineral potential. The most promising deposit is the Red Chris Copper project, which could employ between 250 and 300 people, although this would likely be on a fly-in-fly-out basis.

In addition to the possibility of new mining activity, this area may also experience increased activity in the forest sector. The threefold increase to the Allowable Annual Cut of the Cassiar Timber Supply Area in the last AAC determination could create significant employment in British Columbia's Northwest. A large portion of the benefits will accrue to the Stikine region, but the Telegraph Creek area should also benefit from the increased harvest.

DEMOGRAPHICS

The population base of this area is extremely small and therefore the demographic structure of the area tends to be erratic, changing annually. Due to the remote location, residents tend to be much younger, on average, compared to the province as a whole. The median age is about eight years younger than the provincial median. Also, the gender ratio is heavily weighted in favour of males. There are proportionately fewer elderly people in the population, but the ratio of children (aged 17 and under) to working age population (aged 18 to 64) has been consistently higher than for the province as a whole. Part of this is due to a very high total fertility rate.

PROJECTIONS

This area should reap some of the benefits of the huge increase to the AAC of the Cassiar TSA. Mineral potential in the area is good and could also lead to some population growth. In the long-term, there could be significant growth in this area.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 161: VANCOUVER-CITY CENTRE

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

This sub-area of Vancouver has a substantially different demographic make-up than British Columbia as a whole. The age structure is dominated by people of working age (18 to 64), with the ratio of children and elderly to working age population just over 20 per cent, compared to just under 55 per cent for the province as a whole. The fertility rate is a fraction of the provincial rate. Basically, the area is home to younger people with few children living in condominiums for the most part. Once these people begin to form families they move to other parts of Vancouver, or elsewhere, out of condominiums and into detached housing.

PROJECTIONS

In recent years this area has grown at a rate far exceeding that of Vancouver as a whole. This high level of growth is expected to continue for the next couple of years as major condominium developments are completed, then should level off at a rate more comparable to the region as a whole. The area can continue to expect high levels of positive net migration throughout the projection.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 162: VANCOUVER-DOWNTOWN EASTSIDE

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

This sub-area of Vancouver has quite a different demographic make-up than that of the province as a whole, or even that of the Vancouver area as a whole. For one thing, there are substantially more males than females in this area, in contrast to both the Vancouver aggregate area, and British Columbia as a whole, where the reverse is the case. Also, the median age is significantly higher than the provincial median age. This is mainly because there are proportionately far fewer children in this area compared to the province as a whole.

PROJECTIONS

This area should benefit from Vancouver's designation as part of the Growth Concentration Area, and should continue to experience strong population growth throughout the projection period.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

BC STATS will not be responsible for any errors, interpretive or otherwise, or erroneous conclusions drawn as a result of the use of these data.

LOCAL HEALTH AREA 163: VANCOUVER-NORTH EAST

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

Relative to the Vancouver area as a whole, this sub-area has a much more similar demographic structure to that of the province as a whole. The exception is that the median age of the population is significantly younger than the provincial median age. However, the ratio of children (aged 0 to 17) and elderly (aged 65 and over) over the working age population (aged 18 to 64) is much closer to the provincial ratio than is the ratio for the Vancouver aggregate. This is probably due to the more residential nature of the sub-area, compared to, say, the City Centre.

PROJECTIONS

This area should benefit from Vancouver's designation as part of the Growth Concentration Area, and should continue to experience strong population growth throughout the projection period.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

BC STATS, Ministry of Finance and Corporate Relations, Government of British Columbia, grants the user of the enclosed tables a non-exclusive, non-assignable, non-transferable license to use the data contained therein for information and analytical purposes. These data are provided for the exclusive use of the subscriber.

LOCAL HEALTH AREA 164: VANCOUVER-WESTSIDE

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

The demographic structure of this area is greatly influenced by the presence of the University Endowment Lands. Students make up a large part of the population and this is reflected in a significantly greater proportion of the population in the 20 to 35 age range. There are proportionately far fewer families in the area as witnessed by the fact that the fertility rate is much lower than the provincial rate, and also by the fact that the ratio of children (aged 0 to 17) over working age population (aged 18 to 64) is substantially lower than the similar ratio for the province as a whole.

PROJECTIONS

This area should benefit from Vancouver's designation as part of the Growth Concentration Area, and should continue to experience strong population growth throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)

Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 165: VANCOUVER-MIDTOWN

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

The age structure of this area is dominated by people of working age (18 to 64), with the ratio of children and elderly to working age population at just over 40 per cent, compared to just under 55 per cent for the province as a whole. The fertility rate is significantly lower than the provincial rate and the median age is less than the provincial median.

PROJECTIONS

This area should benefit from Vancouver's designation as part of the Growth Concentration Area, and should continue to experience strong population growth throughout the projection period.

Prepared by: Population Section, BC STATS,
Ministry of Finance and Corporate Relations,
Government of the Province of British Columbia,
Using P.E.O.P.L.E. Projection Model, Projection 25.

Date run: May 18, 2000.
Prepared for: Ministry of Finance and Corporate Relations.
Enquiries: Population Section, BC STATS
Ministry of Finance and Corporate Relations, (250) 387-0327.

Note: All figures as of July 1.
Child Dep. = Pop(0-17) / Pop(18-64)
Elderly Dep. = Pop(65+) / Pop(18-64)
Households = Census Definition Households
Sex Ratio = Males per 100 females
Crude Dth Rate = Calendar year death estimates per 1000 population
TFR = Lifetime births per 1000 women (15-49), calculated on calendar year estimates

Figures for the period 2000-2026 are projected.
Due to rounding, the sum of the components of change may not equal the total population change.

POPULATION EXTRAPOLATION FOR ORGANIZATIONAL PLANNING WITH LESS ERROR

British Columbia small area population projections result from the application of a "Component/Cohort-Survival" population model to area-specific assumptions dealing with fertility, mortality and migration. The Component/Cohort-Survival method requires separate forecasts of each of the components of population change, namely fertility, mortality and migration. With this information, and with a base year age-specific estimate of population, a projection for any subsequent year is made by promoting each age group in the preceding year to the next highest age group, while at the same time taking into account the effects of net migration, deaths and births. To view the most recent *BC STATS* forecasts please see our WEB page 'www.bcstats.gov.bc.ca/data/pop/pop/popproj.htm'.

P.E.O.P.L.E. Run 25, May 2000

In general, all assumptions relating to migration, births and deaths by small area are based on past conditions, modified wherever possible to take into consideration possible future changes. Consequently, the resulting population projections are not necessarily what will be, but rather what could be, given the realization of these conditions. It is certainly possible that unforeseen changes in factors such as economic development, government policy, land use and zoning will affect future populations. Consequently, the projections should only be regarded as one possible scenario of the future size and age-sex structure of the population.

Terms and Conditions of Utilization of PEOPLE Projection Statistics

LOCAL HEALTH AREA 166: VANCOUVER-SOUTH

GENERAL ECONOMY

The Vancouver area is the economic heart of the province. Manufacturing, trade and services are the main economic activities in the area. The region has excellent transportation links to other centres, including highways, rail and the Port of Vancouver. It is the location of the head offices of several large corporations and is one of the largest business centres in Canada.

The municipalities of the Greater Vancouver Regional District (GVRD) have come to an agreement on a Livable Region Strategic Plan. This plan designates a "Growth Concentration Area" where infrastructure such as rapid transit will be put into place to accommodate increased growth. This plan is certain to affect the growth patterns of this area and neighbouring areas. Vancouver has been designated as part of the Growth Concentration Area, and as a result, the strong growth experienced in the eighties will likely continue for some time.

DEMOGRAPHICS

Relative to the Vancouver area as a whole, this sub-area has a much more similar demographic structure to that of the province as a whole. The ratio of children (aged 0 to 17) and elderly (aged 65 and over) over the working age population (aged 18 to 64) is much closer to the provincial ratio than is the ratio for the Vancouver aggregate. This is probably due to the more residential nature of the sub-area, compared to, say, the City Centre.

PROJECTIONS

This area should benefit from Vancouver's designation as part of the Growth Concentration Area, and should continue to experience strong population growth throughout the projection period.
